Q

Q is the seventeenth letter of the English Alphabet; an articulation borrowed from the oriental *hoph* or *goph*, Ch. and Heb. *ק*, Samaritan *ק*, Syriac *ܩ*, Arabic *ق*, *haf*. It is supposed to be an articulation more deeply guttural than that of *K*; indeed, it may have been pronounced as we pronounce *qu*; for we observe that in the Latin language, from which the moderns have borrowed the letter, it is always followed by *u*, as it is in English. This letter is not in the Greek alphabet. In our mother tongue, the Anglo-Saxon, this letter is not used; but in the place of *qu*, *cu*, or more generally, *cw* is used; as in *cwic*, quick; *cween*, queen. This letter is superfluous; for *ku* or *ko*, in English, have precisely the same sounds as *qu*. It is alleged that in expressing *q*, the cheeks are contracted, and the lips put into a canular form, for the passage of the breath; circumstances which distinguish it from *k*. This appears to be a mistake. This position of the organs is entirely owing to the following letter *u*; and *huestion* and *question* are pronounced precisely alike, and with the same configuration of the organs. For *qu* in English, the Dutch use *kw*, the Germans *qu*, the Swedes and the Danes *qv*, which answer to our *kw*. The Gothic has a character which answers to *qu*. It appears then that *q* is precisely *k*, with this difference in use, that *q* is always followed by *u* in English, and *k* is not. *Q* never ends an English word. Its name *cue*, is said to be from the French *queue*, a tail. As a numeral, *Q* stands for 500, and with a dash, *Q̄*, for 500,000. Used as an abbreviation, *Q*, stands for *quantity* or *quantum*; as, among *physicians*, *q. pl.* *quantum plaacet*, as much as you please; *q. s.* *quantum sufficit*, as much as is required, or as is sufficient. *Q. V.* stand for *quantum vis*, as much as you will; or *quod vide*, which see; *Q. D.* for *quasi dictum*, as if it were said.

Among *mathematicians*, *Q. E. D.* stand for *quod erat demonstrandum*, which was to be demonstrated; *Q. E. F.* *quod erat faciendum*, which was to be done. In the *notes of the ancients*, *Q.* stands for *Quintus* or *Quintius*; *Quint.* for *Quintilius*; and *Quaes.* for *quaestor*. In English, *Q.* is an abbreviation for *question*. *Qy.* or *Qu.* for *query*.

Hadley's Quadrant.

quadrant, an arc of forty-five degrees is made to serve the same purpose as an arc of ninety degrees. *Hadley's quadrant*, in its principle and application, is the same as the sextant, by which it has been superseded. [See **SEXTANT**.] For astronomical purposes the quadrant has, of late years, been entirely superseded by the *maral circle*, it having been found that the circle, on account of the symmetry of its form and the advantage which it possesses of allowing the readings to be made at different parts of the limb, is an instrument much more to be relied on.—

QUADRANT ELECTROMETER, *n.* An instrument adapted to measure the

intensity of the electricity contained in any electrified body, otherwise called *Henley's Electrometer*. It consists of a slender rod of very light wood, serving as an index, terminated by a small pith-ball, and suspended from the upper part of an upright stem of wood, the lower end of which is fitted to a hole in the upper surface of the conductor of an electric machine. An ivory semicircle or quadrant is affixed to the stem, having its centre coinciding with the axis of motion of the rod. When the instrument is electrified, by being placed on the electrified conductor, the index is made to diverge from the stem by repulsion, and the number of degrees which it passes over on the semicircle indicates the amount of electricity with which the apparatus is charged.

Quadrant Electrometer.

QUADRAT, *n.* [L. *quadratus*, squared.]

1. In *printing*, a piece of metal used to fill the void spaces between words, &c. Quadrats are of different sizes; as, *m-quadrats*, *n-quadrats*, &c.—2. Quadratic equations are of two kinds, *incomplete*, or *pure*, and *complete*, or *affected*. The incomplete equation is that which contains only terms affected by the square, and not by the simple power of the unknown quantity; as, $ax^2 = b$. The complete or *affected* quadratic equation consists of three terms containing the square of the unknown quantity in one, the simple power in another, and the known quantity in a third. Its general form is $ax^2 + bx = c$, and it is always reducible to the form $x^2 \pm ax = \pm b$. Every quadratic equation has necessarily two roots or values of the unknown quantity.

QUADRATURE, *n.* [L. *quadratura*.] 1. The act of squaring; the reducing of a figure to a square. Thus the finding of a square which shall contain just as much area as a circle or a triangle, is the *quadrature* of that circle or triangle. The quadrature of the circle is a problem of great celebrity in the history of mathematical science. The whole circular area being equal to the rectangle under the radius, and a straight line equal to half the circumference, the quadrature would be obtained if the length of the circumference were assigned; and hence the particular object aimed at in attempting to square the circle is the determination of the ratio of the circumference to the diameter. This ratio can only be expressed by infinite series. The method of *quadratures* forms a branch of the Integral Calculus.—2. A quadrature; a square.—3. In *astron.*, the aspect of the moon when distant from the sun ninety degrees or a quarter of the circle; or when the moon is at an equal distance from the points of conjunction and opposition.—*Quadrature of curves*, in *math.*, the finding of rectilinear figures containing the same areas as figures bounded by curved lines.

QUAKER, *n.* One that quakes; but usually applied to one of the religious sect called the *Society of Friends*. This sect had its origin in England about the middle of the seventeenth century. Its founder was George Fox, a native of Drayton in Leicestershire. He proposed but few articles of faith, insisting chiefly on moral virtue, natural charity, the love of God, and a deep attention to the inward motions and secret operations of the Spirit. The quakers reject all sacraments, and they appoint no *order* of ministers, but consider the instruction and edification of their congregations to be the province of any person of either sex, who conceives himself or herself to be called to the service. When satisfied of their being thus divinely qualified, they are acknowledged ministers; but the Quakers believe such can only exercise their gift acceptably, or profitably, by the assistance of the Holy Spirit at the time. They exhibit great sobriety of behaviour, a singular probity and uprightness in their dealings, a great frugality at their tables, and a remarkable plainness and simplicity in their dress. They refuse to take judicial oaths, but from these the law exempts them. The name, *quakers*, was given in reproach, by a persecuting Justice, because Fox admonished him to *tremble* at the word of the Lord; and on account of some of them being seen to tremble while preaching—but it was never adopted by the Society.

QUANTITY, *n.* [Fr. *quantité*; from L. *quantitas*, from *quantus*, how much, or as much as; Pers. *chand*, how much; *chandî*, quantity.] 1. That property of any thing which may be increased or diminished. This definition is defective, and as applicable to many other properties as to quantity. A definition strictly philosophical can-

not be given. In common usage, *quantity* is a mass or collection of matter of indeterminate dimensions or weight, but consisting of particles which cannot be distinguished, or which are not customarily distinguished, or which are considered in the aggregate. Thus we say, a *quantity* of earth, a *quantity* of water, a *quantity* of air, of light, of heat, of iron, of wood, of timber, of corn, of paper. But we do not say, a *quantity* of men, or of horses, or of houses; for as these are considered as separate individuals or beings, we call an assemblage of them, a *number* or *multitude*. *Quantity* is distinguished into *continued* and *discrete*. It is continued when the parts are connected together, and is then called *magnitude*, which is the object of geometry. It is discrete when the parts have an unconnected and independent existence, forming multitude or number, which is the object of arithmetic.—2. An indefinite extent of space.—3. A portion or part.

If I were sawed into quantities, *Shak.* 4. A large portion; as, a medicine taken in *quantities*, that is, in *large quantities*.—5. In *math.*, any thing which can be multiplied, divided, or measured. Thus mathematics is called the science of quantity. In algebra, quantities are *known* and *unknown*. *Known quantities* are usually represented by the first letters of the alphabet, as *a, b, c*, and *unknown quantities* are expressed by the last letters, *x, y, z*, &c. Letters thus used to represent quantities are themselves called *quantities*. A simple quantity is expressed by one term, as $+a$, or $-abc$; a compound is expressed by more terms than one, connected by the signs, $+plus$, or $-minus$, as $a+b$, or $a-b+c$. Quantities which have the sign $+$ prefixed, are called *positive* or *affirmative*; those which have the sign $-$ prefixed are called *negative*.—*Similar quantities* are such as consist of the same letters, and the same powers of the letters; as *abc*, $-3abc$, $+6abc$, $-9abc$. *Unlike* or *dissimilar quantities* are those which consist of different combinations of letters; as *ab*, *ab²*, *3abc*, *4xy*, &c.—6. In *gram.*, the measure of a syllable; that which determines the time in which it is pronounced.—7. In *logic*, a category, universal, or predicament; a general conception.—8. In *music*, the relative duration of a note or syllable.—*Quantity of matter*, in a body, is the measure arising from the joint consideration of its magnitude and density. Or the quantity of matter in a body is proportional to the magnitude and density of the body conjointly, and is measured by its absolute weight. [See MASS.] *Quantity of motion*, in a body, is used synonymously with *momentum*, to denote the product of the quantity of matter in the moving body by its velocity.

Hence,—2. Restraint of intercourse to which a ship is subjected on the presumption that she may be infected, either for forty days or for any other limited term. It is customary for the proper officers to determine the period of restraint at their discretion, according to circumstances. QUAR'RY, *n.* [Fr. *carrière*, formerly Norm. *quarrier*. We doubt whether the original sense of this word was a pit or mine, from *digging*, or whether the sense was a place for squaring stone. The Fr. *carrière* signifies not only a quarry, but a career, course, race, from the *L. curro*, which cannot be from squaring. If the sense was a pit, it may be referred to the Heb. Ch. and Eth. כְּרֵה, *kerah*, to dig; Ar. *kara* or *hwara*, to dig, to run violently, to leap. If the sense is from *squaring*. *See* **SQUARE**.] 1. A special commission of justices. A justice of the peace is of the *quorum*, when his commission expresses that he is one of those whose presence is necessary to constitute a bench, as at quarter-sessions. The term *quorum* is derived from the words used in the Latin form of the commission issued to justices of the peace; in which the expression occurred, "*quorum unum A. B. esse volumus*," "of whom we will that A. B. be one;" thus rendering it necessary that certain individuals (said to be of the quorum) should be present at the transaction of business. Hence when in an assembly, committees, &c., it is necessary that a certain number should be present to give validity to its acts, that number is generally said to constitute a quorum.

Proceedings under it are prosecuted before the judges of the court of king's (queen's) bench, and the defendant is called upon to show by what warrant (*quo warranto*) he exercises the office, liberty, or franchise in question. The writ itself is fallen into disuse, but the same end is attained by the attorney-general filing an information in the nature of a *quo warranto*.

R

R IS the eighteenth letter of the English Alphabet, and an articulation *sui generis*, having little or no resemblance in pronunciation to any other letter. But from the position of the tongue in uttering it, it is commutable with *l*, into which letter it is changed in many words by the Spaniards and Portuguese, and some other nations; as *l* is also changed into *r*. It is numbered among the liquids and semi-vowels, and is sometimes called the canine letter. It is uttered with a guttural extrusion of the breath, and in some words, particularly at the end or after a labial and a dental letter, with a sort of quivering motion or slight jar of the tongue. Its English

uses, which are uniform, may be understood by the customary pronunciation of *rod, room, rose, bar, bare, barren, disturb, catarrh, free, brad, pride, drip, drag, drown*. In words which we have received from the Greek language, we follow the Latins, who wrote *h* after *r*, as the representative of the aspirated sound with which this letter was pronounced by the Greeks. It is the same in the Welsh language. But as the letter is not aspirated in English, *h* is entirely superfluous; *rhapsody, rheum, rhetoric* being pronounced *rapsody, reum, retoric*. As an abbreviation, *R*, in English, stands for *rex*, king, as George *R.*, or for *regina*, queen; as Victoria *R.*, also for

royal; as *R. N.*, Royal Navy; *R. A.*, Royal Academy or Academician; *R. M.*, Royal Marines. *R. M.* also stand for Ready Money. In the notes of the ancients, *R.* or *RO.* stands for *Roma*; *R. C.* for *Romana civitas*; *R. G. C.* for *rei gerendæ causa*; *R. F. E. D.* for *recte factum et dictum*; *R. G. F.* for *regius filius*; *R. P.* *respublica*, or *Romani principes*. As a numeral, *R*, in Roman authors, stands for 80, and with a dash over it, *R̄*, for 80,000. But in Greek, *Ϟ*, with a small mark over it, thus *Ϟ̄*, signifies 100, and with the same mark under it, it denoted 1000 × 100, or 100,000. In Hebrew, *ר* denoted 200, and with two horizontal points

over it, \sim , 1000 \times 200, or 200,000. Among physicians, R. or B stands for *recipe*, take.

RA, as an inseparable prefix or preposition, is the Latin *re*, coming to us through the Italian and French, and primarily signifying *again*, *repetition*. [See RE.]

RAD'DIANCE, } *n.* [*L. radians*, *radio*,
RAD'DIANCY, } to beam or shoot rays. See **RADIUS** and **RAY**.] Properly, brightness shooting in rays or beams; hence in general, brilliant or sparkling lustre; vivid brightness; as, the *radiance* of the sun.

Milton.

Radiant heat. When a hot body is suspended in the air, a quantity of heat is emitted in all directions by its surface, passing off in right lines like the radii of a circle. The heat so emitted is termed *radiant heat*, and its quantity is greatly dependent upon the nature of the heated surface. It is smallest from polished metallic surfaces, and greatest from rough and unmetalloid surfaces.—*Radiant point*, in *optics*, the point from which rays proceed; also called the *radiating point*.—*Radiant flower*, in *bot.* [See **RADIATE**.]—*Radiant*, in *her.*, is an epithet for a charge when it is represented with rays or beams about it.

A Chief Radiant.

RAD'DIANT, *n.* In *optics*, the luminous point or object from which light emanates, that falls on a mirror or lens.—2. In *geom.*, a straight line proceeding from a given point or fixed pole, about which it is conceived to revolve.

RAD'DIANTLY, *adv.* With beaming brightness; with glittering splendour. **RAD'DIATA**, } *n.* [*L. radius*.] The **RAD'DIARIES**, } name given by Cuvier to the fourth great division of the animal kingdom, including those animals whose parts are arranged round an axis, and on one or several radii, or on

one or several lines extending from one pole to the other. This division comprehends the echinodermata, the entozoa, the acalapha, the polypi or polypodes, and the infusoria.

RAD'DIATE, *v. i.* [*L. radio*. See **RAY**.] 1. To issue in rays, as light; to dart, as beams of brightness; to shine.

RAD'DIATION, *n.* [*L. radiatio*.] 1. The emission and diffusion of rays of light; beamy brightness.—2. The shooting of any thing from a centre, like the diverging rays of light.—3. In *physics* and *meteorology*, the emission of rays of light and heat from a luminous or heated body. The theory of the radiation and conduction of heat has been reduced by the successive labours of Prevost, Leslie, Fourier, Biot, Laplace, Poisson, Forbes, and others, to a purely mathematical form, and thereby placed in the same rank with physical optics. The intensity of radiation varies with the nature of the radiating body, and the state of its surface with regard to polish, colour, source of heat, &c. Its intensity in a vacuum is inversely as the square of the distance from the radiating point.—*Solar radiation*, the heat which the earth receives from the sun.—*Terrestrial radiation*, the heat which escapes from the earth into the regions of space.

RAD'DICAL, *a.* [Fr. from *L. radicalis*, from *radix*, root. See **RACE** and **RAY**.] 1. Pertaining to the root or origin; original; fundamental; as, a *radical* truth or error; a *radical* evil; a *radical* difference of opinions or systems.—2. politics, that political party in this country holding opinions ultra liberal, and occasionally bordering on republican-ism.

RAD'DICAL, *n.* In *philology*, a primitive word; a radix, root, or simple undeviated uncompounded word.—2. A primitive letter; a letter that belongs to the radix.—3. In *modern politics*, a person who advocates a *radical* reform, or extreme measures in reformation.—4. In *chem.*, the original principle of a compound, or that which constitutes the distinguishing part of an acid or a base, by its union with oxygen, or other acidifying and basifying principles. The known radicals of acids are certain compounds of carbon and oxygen, cyanogen, mellone, benzule, cinnamule, salicule, acetule, and formule. The radicals forming bases are amide, ethule, methule, cetule, amule, and glycerule.—*Compound radicals*, a certain class of compound bodies possessing the property of uniting with the elements, and of forming with them combinations which are analogous in their properties to the combinations of two simple bodies; combinations, therefore, in which the elementary body may be removed, and its place occupied by the equivalent quantities of other simple bodies. The compound radicals are capable of uniting with each other; they form, with oxygen and sulphur, acids, and bases; many of them unite with hydrogen producing hydracids.—*Radical quantities*, in *alge.*, quantities whose roots may be accurately expressed in numbers. The term is sometimes extended to all quantities under the radical sign.—*Radical sign*, the sign $\sqrt{\quad}$ placed before any quantity, denoting that its root is to be extracted; thus, \sqrt{a} or $\sqrt{a+b}$. To distinguish the particular root to be extracted a number is prefixed to the sign: thus $\sqrt[2]{\quad}$, $\sqrt[3]{\quad}$, $\sqrt[4]{\quad}$, &c., denote, respectively, the square root, cube root, fourth root, &c. In the case of the square root, however, the number is usually omitted, and merely the sign $\sqrt{\quad}$ written. Fractional exponents are frequently used instead of the radical sign, in which case the index of the quantity forms the numerator, and the root to be extracted the denominator: thus, $x^{\frac{1}{2}}$ is equivalent to $\sqrt{x^2}$.

RAD'DICALISM, *n.* The doctrine or principle of making radical reform in government, by overturning the present state of things, and changing it for one supposed to be better.

It is a general radius to the curve, and has the addition of *vector* [Lat. a carrier], because it is imagined to carry forward the body to which it is attached. The earth, for example, moves in an elliptic orbit, of which the sun (the centre of force) is in one of the foci; and of consequence the radius vector is continually increasing in length during her course from the perihelion to the aphelion, and decreasing in the same proportion in the progress of her return. It is a law of the planetary motions that the radius vector passes over equal areas of the orbit in equal times.

—*Radius bars*, the guide bars of the parallel motion of a steam engine.

RAD'IX, *n.* [L. a root.] In *etym.*, a primitive word from which spring other words.—2. Any number which is arbitrarily made the fundamental number or base of any system. All other numbers are considered as some powers or roots of the radix, the exponents of which powers or roots constitute the logarithms of those numbers respectively.—3. In *alge.*, *radix* sometimes denotes the root of a finite expression, from which a series is derived.

RAILS, *n.* The parallel tracks which are laid on railways for the purpose of diminishing the resistance, and restricting the course of the carriage wheels which run upon them; the wheels being guided laterally by flanges projecting from the insides of their tires. They are now almost universally formed of wrought iron bars, (though formerly made sometimes of wood and sometimes of cast iron) laid in continuous and uninterrupted lines, and carried, at short intervals, upon cast iron supports

they are frequently termed *tram roads*, or *tram ways*. The modern railway consists of one or more series of pairs of iron beams or girders called rails, laid parallel to each other, and several feet apart. The width between the rails is called the *gauge*. The *narrow gauge* measures 4 feet 8½ inches between the rails; the *broad gauge* 7 feet. A pair of parallel rails constitutes a *single line* of railway, two pairs, a *double line*, and so on; the width between the lines is generally 6 feet. The rails are supported at a little height above the general surface by iron pedestals called *chairs*, which again are firmly fixed to wooden or stone supports called *sleepers*, placed at intervals and imbedded in the material of the roadway. A railway, in general, approaches as nearly to a straight line between its two extremes or *termini* as the nature of the country and the necessities of the intermediate traffic will permit. It is carried over valleys, either by *embankments* or *viaducts*, and through hills or elevated ground by deep trenches called *cuttings*, or by tunnels. In favourable cases the surface line of the railway is so adjusted that the materials excavated from the cuttings will just serve to form the embankments. Such a line is termed the *balancing line*. Should the excavated material be in excess it is termed *spoil*, and deposited in a convenient place, where it forms a *spoil bank*; but should it be in too small quantity to form the embankment, recourse is had to an excavation along the sides of the site of the latter to supply the deficiency. This is termed *side cutting*. The balancing line or surface line of the railway may or may not be level, and its various slopes are termed *gradients*, and the arrangement of the rises and falls is termed the *grading* of the line. A very steep ascent is termed an *incline*. When the line is formed its surface is covered with broken stones or clean gravel called *ballasting*, and in this the wooden *sleepers*, or stone blocks for sustaining the rails, are imbedded. In their simplest form sleepers are pieces of timber 5 or 6 inches by 9 or 12 inches broad, and 9 or 10 feet long, laid across the line at about 3 feet apart from centre to centre, and to them the chairs which sustain the rails are spiked. Sometimes longitudinal wooden sleepers are used along with the transverse sleepers. These consist of beams laid under the rails and secured to the transverse sleepers. When such are used chairs are frequently dispensed with, the rails being formed with a flange at bottom which is fastened directly to the wooden beam. When the railway is thus completed, the work is called the *permanent way*. In the railway of a single line of rail, it is necessary to make provision for permitting meeting carriages to pass each other by means of *sidings*, which are short additional railways laid at the side of the main line, and so connected with it at each extremity that a carriage can pass into the siding in place of proceeding along the main line. In double lines, in addition to sidings, which are in them also required, it is necessary to provide for carriages crossing from one line to another. The change in the direction of the carriage, in both cases, is effected by switches and turntables. The an-

nexed cut shows a system of rails arranged for the junction of one double line of rails with another, and known as a *main-line junction*.

Junction Rails.

a a, *b b*, switches or movable rails connected by rods to the reversing bar *c c*; *a a*, single crossings, the extremities of the rails being formed so as to clear and guide the flanges of the wheels; *d d*, double crossings, for the same purpose, with guard or check rails, to assist in guiding the wheels by their flanges through the crossings. [See SWIRREN.]

The various places along the line of railway, where carriages stop for taking up or depositing goods or passengers, are termed *stations*, with the prefix of *goods* or *passenger*, as they are allotted to the one or the other; and they are termed *road stations*, when they occur at the crossing of a public road, where goods or passengers are transferred to other kinds of conveyance. Where warehouses are attached they are called *dépôts*. At the extremities of the railway, or the *termini*, compartments of the stations are generally allotted to goods and passenger traffic, with branches from the main line carried to each. At stations are *turnplates*, or *turntables*, and other contrivances for removing carriages from one line to another. Either horse or steam power is applied to move the carriages on a railway. When horse power is used, the part between the rails is formed into a road on which the animal walks and drags after it the carriages. Steam power is employed in three different ways. First, the steam engine is mounted on a framework, with wheels made to run upon the rails. The engine is then called a *locomotive engine*, and its pressure on the rails generates a tractive force by which it is enabled to move at a high rate of velocity, and to drag great loads after it. 2nd, A fixed engine is employed to give motion to a rope by which the carriages are dragged along, the rope being either an endless rope stretched over pulleys, or one which winds and unwinds on a cylinder. Such engines are termed *stationary engines*, and are used chiefly on inclined planes, where the ascent is too steep for the locomotive engine. 3rd,

or *chairs*, resting either upon transverse timber *sleepers* or upon blocks of stone. The annexed figures show some of the most common forms of section of these bars and of their supports. Fig. 4, which is the form employed by Mr. Brunel in the Great Western Railway, rests on continuous longitudinal timber bearings without the intervention of chairs.

RAILWAY, *n.* [*rail* and *way*, or **RAILROAD**, *n.* *road.*] A road or way having parallel tracks along it, formed of wood or iron, on which the wheels of carriages are made to run in order to lessen friction. These tracks were originally formed of wooden beams called rails, and the wheels of the waggons were cylindrical, and had flanges on one side of the periphery, which confined them to the tracks. The wooden rails were succeeded by iron plates, with flanges or upturned edges along one side, to prevent the wheels leaving them. These were termed *plate rails*, and are now little used, being superseded by the *edge rails* of the modern railway. The wooden rails and plate rails were chiefly used for the accommodation of coal waggons called *trams*, from which circumstance

Engines are placed at intervals along the line, and employed to exhaust the air in a tube laid between the rails by working air-pumps; the tube is fitted with an air tight piston and provided with a longitudinal slit, through which a projection from the piston passes, and can be connected with the carriages outside. The slit is covered with a valve of peculiar construction. When the air is exhausted in the tube in front of the piston the atmospheric pressure forces the piston forward, and along with it the carriages, the valve opening to allow the passage of the projecting connecting part, and closing immediately behind it. This is called the *atmospheric railway*.

RAIMENT, n. [for *arrayment*; Norm. *araer*, to array; *araies*, array, apparel. See **ARRAY** and **RAY**.] 1. Clothing in general; vestments; vesture; garments; Gen. xxiv.; Dent. viii.

RAIN, v. i. [Sax. *hregnan*, *regnan*, *renian*, *rinan*, to rain; D. and G. *regen*, rain; D. *regenen*, to rain; Dan. *regn*, rain; *regner*, to rain; G. *beregnen*, to rain on. It seems that rain is contracted from *regen*. It is the Gr. *βρυση*, to rain, to water, which we retain in *brook*, and the Latins, by dropping the prefix, in *rigo*, *irrigo*, to irrigate. The primary sense is to pour out, to drive forth, Ar. *baraka*, coinciding with Heb. Ch. and Syr. *barak*.] 1. To fall in drops from the clouds, as water; used mostly with it for a nominative; as, it rains; it will rain; it rained, or it has rained.—2. To fall or drop like rain; as, tears rained at their eyes.

RAIN, v. i. To pour or shower down from the upper regions, like rain from the clouds.

Then said the Lord to Moses, Behold, I will rain bread from heaven for you; Exod. xvi.

God shall cast the fury of his wrath upon him, and shall rain it upon him while he is eating; Job xx.

Upon the wicked he shall rain snares, fire, and brimstone, and a horrible tempest; Ps. xi.

RAIN, n. [Sax. *raegn*, *regn*, *ren*.] The descent of water in drops from the clouds; or the water thus falling. Rain is distinguished from *mist*, by the size of the drops, which are distinctly visible. When water falls in very small drops or particles, we call it *mist*, and *fog* is composed of particles so fine as to be not only indistinguishable, but to float or be suspended in the air. Rain depends upon the formation and dissolution of clouds. The humidity suspended in the atmosphere, which forms clouds, and is deposited in rain, is derived from the evaporation of water, partly from land, but chiefly from the vast expanse of the ocean. According to Dr. Hutton, the capacity of the air for moisture increases with the temperature, but in a much higher ratio than the temperature; and hence, it follows that, if two equal portions of air at different temperatures, both completely saturated with moisture, are mingled together, a precipitation of rain must take place in consequence of the mixture, which will have the mean temperature of the two portions, being

unable to sustain the mean quantity of vapour. The average quantity of rain which falls in a year at any given place depends on a great variety of circumstances; as, latitude, proximity to the sea; elevation of the region, configuration of the country, and mountain ranges, exposure to the prevailing winds, &c.

RAINBAT, or RAINBEAT, † a. Beaten or injured by the rain.

RAINBOW, n. A bow, or an arc of a circle, consisting of all the colours formed by the refraction and reflection of rays of light from drops of rain or vapour, appearing in the part of the hemisphere opposite to the sun. When the sun is at the horizon, the rainbow is a semicircle. The rainbow is called also *iris*. This well known meteor presents, when perfect, the appearance of two concentric arches; the inner being called the *primary*, and the outer the *secondary* rainbow. Each is formed of the colours of the solar spectrum, but the colours are arranged in the reversed order, the red forming the exterior ring of the primary bow, and the interior of the secondary. The primary bow is formed by the sun's rays entering the upper part of the falling drops of rain, and undergoing two refractions and one reflection; and the secondary, by the sun's rays entering the under part of the drops, and undergoing two refractions and two reflections. Hence, the colours of the secondary bow are fainter than those of the primary. The moon sometimes forms a bow or arch of light, more faint than that formed by the sun, and called *lunar rainbow*. Similar bows at sea are called *marine rainbows*, or *sea bows*.

RAIN GAUGE, n. An instrument for measuring or gauging the quantity of rain which falls at a given place. Rain gauges are variously constructed. One

convenient form consists of a cylindrical tube of copper, with a funnel at the top where the rain enters. Connected with the cylinder at the lower part is a glass tube with an attached scale. The water which enters the funnel, stands at the same height in the cylinder and glass tube, and being visible in the latter the height is read immediately on the scale, and the cylinder and tube being constructed so that the sum of the areas of their sections is a given part, for instance a tenth of the area of the funnel at its orifice, each inch of water in the tube is equivalent to the tenth of an inch of water entering the mouth of the funnel. A stop-cock is added for drawing off the water.

Rain Gauge.

This word is in some places pronounced corruptly *reezn*.] A dried grape. Raisins are produced from various species of vines; deriving their names partly from the place where they grow, as Smyrnas, Valencias, &c.; and partly from the species of grape of which they are made, as muscatels, blooms, sultanas, &c. Their quality appears, however, to depend more on the method of their cure than on any thing else. The finest raisins are cured either by cutting the stalk of the bunches half through, when the grapes are nearly ripe, and leaving them suspended on the vine till the sun dries and candies them; or by cutting the grapes when fully ripe, and dipping them in a ley made of the ashes of the burnt tendrils, after which they are exposed to the sun to dry. Those cured in the first way are most esteemed. The inferior sorts are very often dried in ovens.

Had *rathier*, is supposed to be a corruption of *would rathier*.

RA'TIO, *n.* (ra'sho.) [L. *ratus*, *reor*, to think or suppose, to set, confirm, or establish. *Reor* is contracted from *redor* or *retor*, and primarily signifies to throw, to thrust, hence to speak, to set in the mind, to think, like L. *suppono*; and *setting* gives the sense of a fixed rate or rule. See REASON.]

Proportion, or the relation of homogeneous things which determines the quantity of one from the quantity of another, without the intervention of a

third. In *geom.*, Euclid defines *ratio* to be "a mutual relation of two magnitudes of the same kind to one another in respect of quantity." In arithmetic and algebra, a *ratio* may be defined as the function whose numerator is the antecedent, and denominator the consequent of the ratio. Thus the ratio of 4 to 2 is $\frac{4}{2}$ or 2; and the ratio of 5 to 6 is $\frac{5}{6}$. Also the ratio of A to B is

$\frac{A}{B}$. In comparing two subjects with

regard to some quality which they have in common, and which admits of being measured, that measure is their *ratio*. It is the rate in which one exceeds the other. *Proportion* is the *portions* or parts of one magnitude that are contained in another. When the ratio is commensurable (that is, when it is reducible to numbers), it is equivalent to proportion; but the latter term is usually employed in the comparison of ratios, in which case two equal ratios are said to be proportionals. Thus 3 has to 4 a certain ratio or proportion; but the expression 3 is to 4 in the same proportion as 6 to 8, denotes that the ratios of 3 to 4 and 6 to 8 are equal, 3 being the same proportion of 4 as 6 is of 8; that is, of three-fourths.—*Direct ratio*. When two quantities or magnitudes have a certain ratio to each other, and are at the same time subject to increase or diminution; if while one increases the other increases in the same ratio; or if, while one diminishes, the other diminishes in the same ratio; the proportions or comparisons of ratios remain unaltered, and those quantities or magnitudes are said to be in a *direct ratio* or proportion to each other. Thus in uniform motion the space is in the direct ratio of the time.

—*Inverse ratio*. When two quantities or magnitudes are such that when one increases the other necessarily diminishes; and *vice versa*, when the one diminishes the other increases, the ratio or proportion is said to be *inverse*. Thus in uniform motion the time is in the inverse ratio of the velocity.—*Compound ratio*. When one quantity is connected with two others in such a manner that if the first be increased or diminished, the product of the other two is increased or diminished in the same proportion, then the first quantity is said to be in the *compound ratio* of the other two. Thus the momentum of a moving body is in the *compound ratio* of the quantity of matter and the velocity.—*Duplicate ratio*. When three quantities are in continued proportion, the first is said to have to the third the *duplicate ratio* of that which it has to the second, or the first is to the third as the square of the first to the square of the second. Also, when any number of quantities are in continued proportion, the ratio of the first to the last is said to be compounded of the several intermediate ratios. *Ratio* respects magnitudes of the same kind only. One line may be compared with another line, but a line cannot be compared with a superficies, and hence between a line and a superficies there can be no *ratio*.

—2. *Prime and ultimate ratios*, terms first introduced, at least in a system, by Newton, who preferred them to the terms suggested by his own method of fluxions. The method of prime and ultimate ratios is a method of calculation which may be considered as an

extension of the ancient method of exhaustions. It may be thus explained: Let there be two variable quantities constantly approaching each other in value, so that their ratio or quotient continually approaches to unity, and at last differs from unity by less than any assignable quantity; the *ultimate ratio* of these two quantities is said to be a ratio of equality. In general, when different variable quantities respectively and simultaneously approach other quantities, considered as invariable, so that the differences between the variable and invariable quantities become at the same time less than any assignable quantity, the ultimate ratios of the variables are the ratios of the invariable quantities or *limits* to which they continually and simultaneously approach. They are called *prime ratios* or *ultimate ratios*, according as the ratios of the variables are considered as receding from, or approaching to, the ratios of the limits. The first section of Newton's *Principia* contains the development of *prime and ultimate ratios*, with various propositions enunciated in their language.

In *arith.* and *alge.*, a term applied to an expression in finite terms; or one on which no extraction of a root is left; or, at least, none such indicated which cannot be actually performed by known processes. The contraries of these are called *surd* or *irrational* quantities. Thus 2, 9, 12, are *rational* quantities, and

$\sqrt{2}$, $\sqrt[3]{4}$, &c., are *irrational* or *surd* quantities, because their values can only be approximately and not accurately assigned. *Rational horizon*, in *geography*, the plane passing through the centre of the earth parallel to the *sensible horizon* of the place to which it is referred. RATIONALISM, *n.* A system of opinions deduced from reason, as distinct from inspiration or opposed to it; the interpretation of Scripture truths upon the principles of human reason, which has become notorious in the present day by the theological systems to which it has given birth in Germany. From the middle of the last century there has arisen in that country a succession of divines—Baumgarten, Michaelis, Semler, Eichhorn, Paulus, Bretschneider, &c., who have endeavoured either to affix a lower and more human character to the invisible operations of God upon men through Christianity, or to reduce the accounts which we have of the foundation of our religion to the mixture of truth and error natural to fallible men. They have questioned the genuineness of almost all the separate parts of Scripture; and the accuracy of all their supernatural narratives. Of late years, however, a much more spiritual conception of the nature of Scripture promises and Christian assistances is observable in the writings of German divines, under the operation of which their theological criticism has already assumed a more wholesome and exalted tone.

RATIONALIST, *n.* One who proceeds in his disquisitions and practice wholly upon reason.—2. It is contracted from *red*, which the Latins retained in words beginning with a vowel, as in *redamo*, *redeo*, *redintegratio*; Ar. *radda*, to return, restore, bring back, repel, to answer. From the Latin or the original Celtic, the Italians, Spanish, and French have their *re*, *ra*, as prefixes. In a few English words, all or most of which, as believed, we receive from the French, it has lost its appropriate signification, as in *rejoice*, *recommend*, *receive*.

The English sense of reach appears in L. porrigo and porricio. We find in the Shemitic languages, Ch. ܪܓܐ, regag, to desire, to long for; Syr. ragi, and aragi, to desire. This is the Greek ὀφείλω, to reach, to stretch, the radical sense of desiring. The latter Syriac word is the Hebrew ܪܓܐ, arag, to weave; but the primary sense is to stretch or strain. This verb, in Arabic ariga, signifies to send forth a grateful smell, to breathe fragrance, the root of the L. fragro. But the primary sense is the same, to reach, to extend, to shoot forth. The same word in Ethiopic, raga, San. rich'h, signifies to congeal or condense, to make stiff or rigid. This is the L. rigeo, Gr. ψύω, and hence L. frigeo, whence frigid. This sense also is from stretching or drawing, making tense or rigid. The radical sense of ܪܓܐ, raka, is the same, whence region, and the Heb. ܪܓܐ, raki, the expanse of heaven or the firmament. The L. rogo has the same radical sense, to reach, to urge.] 1. To extend; to stretch; in a general sense; sometimes followed by *out* and *forth*; as, *to reach out* the arm. Hence,—2. Thus, in driving a nail with a hammer the stroke acts as powerfully against the face of the hammer as against the head of the nail; and, in pressing the hand upon a stone, the stone presses the hand equally. 5. A faculty of the mind by which it distinguishes truth from falsehood, and good from evil, and which enables the possessor to deduce inferences from facts or from propositions; and to combine means for the attainment of particular ends. Reason is the highest faculty of the human mind, by which man is distinguished from brutes, and which enables him to contemplate things spiritual as well as material, to weigh all that can be said or thought for and against them, and hence to draw conclusions and to act accordingly. A man may therefore be said to possess reason in proportion as he actually exercises that power, that is, reasons and acts according to the conclusions or results at which he has arrived. In the language of English philosophy, the terms reason and understanding are nearly identical, and are so used by Stewart; but in the critical philosophy of Kant, a broad distinction is drawn between them. In the annexed figure, let A B represent a smooth

polished surface, or mirror, and suppose a ray of light proceeding in the direction L P to impinge on the surface at P, and to be reflected from it in the direction P R.

From P draw P Q perpendicular to A B, then the angle L P Q is called the *angle of incidence*, and Q P R the *angle of reflection*. Sometimes, however, the angle L P A is taken for the angle of incidence, and R P B for that of reflection. These two angles are in the same plane, and the angle of reflection is equal to the angle of incidence, and on the opposite side of the perpendicular. This law holds true whatever be the nature of the reflecting surface, or the origin of the light which falls upon it. All the phenomena of reflection from mirrors or polished surfaces, whether plane or having any regular curvature, are readily deduced from this law, as simple geometrical consequences.—2. Reflectors may be either plane or curvilinear; of the former the com-

mon mirror is a familiar example. Curvilinear reflectors admit of a great variety of forms, according to the purposes for which they are employed: they may be either convex or concave, spherical, elliptical, parabolic, or hyperbolic, &c. The parabolic form is, perhaps, the most generally serviceable, being that which is employed in light-houses, and for many other purposes of illumination, as well as for various highly important philosophical instruments. Its property is to transmit, in a parallel stream, and to a great distance, all rays diverging from the focus of the parabola, and conversely. The annexed cut is a section of a ship lantern, fitted with an argand lamp and parabolic reflector. *a a* is the reflector,

Parabolic Reflector.

REFLEX, *n*. Reflection. †—2. In *painting*, the illumination of one body, or a part of it by light reflected from another body represented in the same piece. REFRACT'ING, *ppr.* Turning from a direct course.—2. *a*. That turns rays from a direct course; as, a *refracting* medium.—*Refracting telescope*. [See **TELESCOPE**.]

REFRACT'ION, *n*. The deviation of a moving body, chiefly rays of light, from a direct course. A ray of light, when it enters a medium of a different

density, deviates from its original path and is bent at the surface of the medium. This deviation or bending is called *refraction*, and is the ultimate fact from which many of the most interesting phenomena of light receive their explanation. Suppose a beam of light proceeding from a luminous point S to be admitted through a small hole A, in the side of a vessel A B; then, the vessel being empty, the light will fall on the bottom at a point L, in the same straight line with S and A. Now let water be poured into the vessel, and suppose the beam of light to fall on its surface at P; then it will be seen that the light no longer continues its course in the same straight line, but is bent or *refracted* at P, and proceeds through the water in a straight line P R more nearly perpendicular to the surface. A similar deviation takes place in all cases in which light passes from one transparent medium into another; but the magnitude of the angle R P L, or the amount of the refraction, varies according to the nature of the two media, and the degree of obliquity with which the incident ray falls on the surface of separation. If through P, Q P q be drawn perpendicular to the surface; then S P Q is the *angle of incidence*, and R P q the *angle of refraction*, and both these angles are in the same plane, and they are always on opposite sides of the perpendicular. The sine of the angle of incidence has to the sine of the angle of refraction a constant ratio, whatever be the inclination of the incident ray to the surface. When a ray of light passes from a rarer into a denser medium the refraction is towards the perpendicular, or the angle of refraction is less than the angle of incidence. On the contrary, when a ray of light passes from a denser into a rarer medium, the refraction is from the perpendicular, or the angle of refraction is greater than the angle of incidence.—*The index of refraction* of any transparent substance, is the ratio of the sine of incidence to the sine of refraction, when light passes from a vacuum into the substance.—*Astronomical refraction*, the apparent angular elevation of the heavenly bodies above their true places, caused by the refraction of the rays of light in their passage through the earth's atmosphere, so that in consequence of this refraction the heavenly bodies appear higher than they really are. It is greatest where the body is in the horizon, and diminishes all the way to the zenith, where it is nothing.—*Terrestrial refraction*, that refraction which makes terrestrial elevated objects appear to be raised higher than they are in reality. This arises from the air being denser near the surface of the earth than it is at higher elevations, its refractive power increasing as the density increases.—*Double refraction*, the separation of a ray of light into two separate parts, by passing through certain transparent mediums, as the Iceland crystal. All crystals, except those whose primitive form is either a cube

or a regular octahedron, exhibit double refraction.

REFRACTIVE, *a.* That refracts or has power to refract or turn from a direct course; as, *refractive densities*.—*Refractive power*, in *optics*, the degree of influence which a transparent body exercises on the light which passes through it.—*Absolute refractive power*, or *absolute refraction*, the ratio of the refractive power of a substance to its density.

Newton showed that the sun's light consists of rays which differ in refrangibility, as well as in colour, and on this he founded his whole theory of colours.

Numerous contrivances have been devised for this purpose, but the one most generally used is the *day and night thermometer* of Dr. Rutherford. It consists of two thermometers, the one a mercurial, and the other a spirit thermometer, attached horizontally to the same frame, and each provided with its own scale. The mercurial thermometer contains, as an index, a bit of steel wire which is pushed before the mercury, and is left where the mercury begins to recede, marking how high the temperature had been. The spirit thermometer contains an index of glass half an inch long, with a small knob at each end. This lies in the spirit, which freely passes it when the thermometer rises, but when the spirit recedes the cohesive attraction between the spirit and the glass overcomes the friction arising from the weight of the index, so that it is carried back with the spirit towards the bulb. As there is no force to move it in the opposite direction, it remains at the point nearest the bulb to which it has been brought, and thus indicates the lowest temperature which has occurred during the interval between the observations.

RELIGIEUX, *n. masc.* } [Fr.] In *Ro-*
RELIGIEUSE, *n. fem.* } *man catholic*
countries, a person engaged by vows to follow a certain rule of life authorized by the church. An inhabitant of a monastery is called a *religieux*; that of a nunnery a *religieuse*. A plurality of the one forms *religieux*, of the other *religieuses*.

RELIGION, *n.* (relij'ion.) [Fr. and Sp. *religion*; L. *religio*, from *religo*, to bind anew; *re* and *ligo*, to bind. This word seems originally to have signified an oath or vow to the gods, or the obligation of such an oath or vow, which was held very sacred by the Romans.] 1. Religion, in its most comprehensive sense, includes a belief in the being and perfections of God, in the revelation of his will to man, in man's obligation to obey his commands, in a state of reward and punishment, and in man's accountableness to God; and also true godliness or piety of life, with the practice of all moral duties. It therefore comprehends theology, as a system of doctrines or principles, as well as practical piety; for the practice of moral duties without a belief in a divine lawgiver, and without reference to his will or commands, is not religion.—2. *Religion*, as distinct from *theology*, is godliness or real piety in practice, consisting in the performance of all known duties to God and our fellow men, in obedience to divine command, or from love to God and his law; James i.

Religion will attend you...as a pleasant and useful companion, in every proper place and every temperate occupation of life.

Buckminster.

3. *Religion*, as distinct from *virtue*, or *morality*, consists in the performance of the duties we owe directly to God, from a principle of obedience to his will. Hence we often speak of *religion* and *virtue*, as different branches of one system, or the duties of the first and second tables of the law.

Let us with caution indulge the supposition, that morality can be maintained without *religion*.

Washington.

4. Any system of faith and worship. In this sense, religion comprehends the belief and worship of pagans and Mohammedans, as well as of Christians; any religion consisting in the belief of a superior power or powers governing the world, and in the worship of such power or powers. Thus we speak of the *religion* of the Turks, of the Hindus, of the Indians, &c., as well as of the Christian *religion*. We speak of *false religion*, as well as of *true religion*.

—5. The rites of religion; in the plural.—*Established religion*, that form of religion in a state which is recognized and sanctioned by the state, in distinction from other forms, and to which certain privileges and distinctions are attached. RENT, *n.* [Fr. *rente*, from *rendre*; *D. Dan.* and *G. rente*.] A sum of money, or a certain amount of other valuable thing, issuing yearly from lands or tenements.

Rent in law is defined "a certain profit issuing yearly out of lands and tenements corporeal," not necessarily, although by English usage generally, consisting in money. Rents, at common law, are of three kinds; *rent-service*, *rent-charge*, and *rent-seck*. *Rent-service* is when some corporal service is incident to it, as by fealty and a sum of money; *rent-charge* is when the owner of the rent has no future interest or reversion expectant in the land, but the rent is reserved in the deed by a clause of distress for rent in arrear; *rent-seck*, dry rent, is rent reserved by deed, but without any clause of distress. There are also *rents of assize*, certain established rents of free-holders and copyholders of manors, which cannot be varied; called also *quit-rents*. These, when payable in silver, are called *white rents*, in contradistinction to rents reserved in work or the baser metals, called *black rents* or *black mail*. *Rack-rent* is a rent of the full value of the tenement, or near it. A *fee farm rent* is a rent-charge issuing out of an estate in fee, of at least one fourth of the value of

the lands at the time of its reservation. The time of paying rents is either by the particular appointment of the parties in the deed, or by appointment of law, but the law does not control the express appointment of the parties, when such appointment will answer their intention. In England, Michaelmas and Lady-day are the usual days appointed for payment of rents; and in Scotland, Martinmas and Whitsunday. A reprieve may proceed from the mere pleasure of the crown expressed to the court, or from the discretion of the court itself. Every court which has power to award execution, has also power either before or after judgment to grant a reprieve. Reprieve at the will of the judge is arbitrary, and he has power to give it when he is dissatisfied with the verdict, in order to give time to apply to the crown for a pardon. Reprieve is also *ex necessitate legis*; as, a woman capitally convicted has a right to a reprieve during pregnancy.—2. Respite; interval of ease or relief.

All that I ask is but a short *reprieve*, Till I forget to love, and learn to grieve. *Denham.*

Letters of marque and reprisal may be obtained in order to seize the bodies or goods of the subjects of an offending state, until satisfaction shall be made. Where the people of one nation have unlawfully seized and detained property belonging to another state, the subjects of the latter are authorized by the laws of nations to indemnify themselves, by seizing the property of the subjects of the state aggressing. This is termed making *reprisals*, and commissions to this effect are issued from the admiralty.—3. Recaption; a retaking of a man's own goods, or any of his family, wife, child, or servant, wrongfully taken from him or detained by another. In this case, the owner may retake the goods or persons wherever he finds them.—*Letters of marque and reprisal*, a commission granted by the supreme authority of a state to a subject, empowering him to pass the frontiers [*marque*], that is, enter an enemy's territories and capture the goods and persons of the enemy in return for goods or persons taken by him.—4. Where a witness was offered, to whose admissibility there were objections which could not be immediately verified, it was formerly the practice for the party making the objection, to protest for *reprobator* before the examination of the witness was proceeded with; that is, to protest that it should be afterwards competent for him, in an action of reprobator, to prove that the witness was liable to the objections of agency, enmity, partial counsel, or the like. REPTILE, *n.* 1. In a general sense, an animal that moves on its belly, or by means of small short legs, as snakes, lizards, tortoises, and the like. But the term *Reptiles* or *Reptilia*, when used zoologically, is confined to the designation of those cold-blooded quadruped, biped, apode, oviparous, and ovoviviparous vertebrated animals that breathe by means of lungs principally, and are without hair, feathers, or mamma. Such animals form the subject of that branch of zoological science termed *Herpetology*. Reptiles form the third class of vertebrated animals according to the arrangement of Cuvier, and it is divided into four orders, namely, chelonias or tortoises, sauria or lizards, ophidia or serpents, and batrachia or frogs. Of these four orders the chelonians and batrachians are partly aquatic, partly terrestrial; the saurians and ophidians are principally tenants of the land. A republic may be either an aristocracy or a democracy; the supreme power in the former being consigned to the nobles, or a few privileged individuals, as was formerly the case in Venice and Genoa; while in the latter the supreme power is placed in the hands of rulers chosen by and from the whole body of the people, or by their representatives

assembled in a congress or national assembly. Hamburg, Frankfort, Lübeck, and Bremen are instances of this latter form of government; but the most perfect example of it is to be found in the United States, and in some of the South American confederations which have shaken off the Spanish yoke. Governments usually styled limited monarchies, are properly aristocracies presided over by a king; and consequently ought to be referred to the class of republics, and not to that of monarchies.—2.† Common interest; the public.—*Republic of letters*, the collective body of learned men.

REPULSION, *n.* In *physical science*, that power or principle by which bodies or the particles of bodies under certain circumstances are made to recede from each other. Both attraction and repulsion exist in all the particles of material substances, and seem to be properties by which those particles act upon one another when not in contact. The cause of these actions is utterly unknown to us, and the terms are only applied in conformity to the phenomena exhibited. At all sensible distances bodies small and great, except in certain states, with respect to electricity or magnetism, attract one another. But the phenomena of light and elasticity in general show that at distances which are not appreciable by the eye, both attractions and repulsions take place. The elasticity of bodies is a result either of attractive or repulsive powers, or both. For example, when a steel rod is bent, and allowed to recover itself, a force of attraction will be exerted on one side, and of repulsion on the other. The expansions of solids and fluids by heat, and the elastic powers of gas at different temperatures, are consequences of the repulsions residing in the particles of caloric, or induced by the latter in those of the bodies with which they are combined. The forces both of attraction and repulsion, by which the particles of light are deflected from their course, when they impinge on a refracting or reflecting surface, are enormous, and Sir John Herschel computes that they exceed the force of gravity in the ratio of 2×10^4 to 1. There is a repulsion between oil and water, iron and mercury, between similar poles of magnets, and between bodies in the same electrical state. In air and liquids it has been concluded that the particles do not touch, but are kept asunder at determinate distances

from each other by the constant action of the two forces of attraction and *repulsion*, which are supposed to balance and counteract each other.—2. The act of repelling.

REPULSIVE, *a.* Repelling; driving off, or keeping from approach. The *repulsive* power of the electric fluid is remarkable.—2. Cold; reserved; forbidding; as, *repulsive* manners.

In this analysis a geometrical or physical problem is reduced to another purely algebraical, and the solution is then obtained without any supposition of motion, and without considering quantities as composed of infinitely small particles. *Residual quantity*, in *alge.*, a binomial connected by the sign—(minus); thus $a-b$, $a-\sqrt{6\&c.}$, are residual quantities.—*Residual figure*, in *geom.*, the figure remaining after subtracting a less from a greater.—*Residual phenomenon*, a term lately brought into partial use to signify that part of a phenomenon which is left when every part which can be explained or accounted for is removed. RESIN, *n.* (*s* as *z.*) [Fr. *resine*; L. *It.* and Sp. *resina*; Fr. *roisin*; Gr. *ρῆμα*, probably from *ρῆω*, to flow.] Resins are solid inflammable substances, which are insoluble in water, but soluble in alcohol and essential oils.

When cold they are more or less brittle and translucent, and of a colour inclining to yellow. When pure they are nearly insipid and inodorous. They are non-conductors of electricity, and when excited by friction, their electricity is negative. They are heavier than water, and they melt by heat. They combine with the alkalis of the metals, performing the function of weak acids, and forming soaps. They are soluble in many of the acids, and convertible by some into other peculiar acids. They frequently exude from trees in combination with essential oils, and in a liquid or semi-liquid state. They are composed of carbon, hydrogen and oxygen, and are supposed to be formed by the oxygenation of the essential oils. There is a great number and variety of the resins. They are valuable as ingredients in varnishes, and several of them are used in medicine. They are often naturally blended with gum, in which they constitute the series of *gum-resins*. [See *GUM*.] The soft resins which retain a certain portion of volatile oil constitute what are called balsams. *Kauri* or *Cowdee* resin, a new and very peculiar substance, recently imported from New Zealand, and obtained from a tree called *Dammara australis*, or *Pinus Kauri*. Its colour varies from milk-white to amber, or even deep brown. It affords a fine varnish with alcohol, and also with turpentine. *Resin of aldehyde*, a product of the decomposition of the aqueous solution of aldehyde by caustic potash. When dried and heated to 212° it gives off a very nauseous soapy smell, and it sometimes inflames spontaneously.

RESINOUSLY, *adv.* By means of resin; as, *resinously* electrified.

RESINOUSNESS, *n.* The quality of being resinous.

RES INTER ALIOS ACTA, ALIIS NEC NOCET, NEC PRODEST, [L.] A maxim in *Scots law*, signifying that things done between particular individuals neither injure nor benefit others. It is said of a judgment in a cause which affects only the parties in the cause, and not others, though concerned.

2. The quality of not yielding to force or external impression; that power of a body which acts in opposition to the impulse or pressure of another, or which prevents the effect of another power; as, the *resistance* of a ball which receives the force of another; the *resistance* of wood to a cutting instrument; the *resistance* of air to the motion of a cannon-ball, or of water to the motion of a ship. The *resistance* produced by the rubbing of the surfaces of two bodies against each other, caused by the asperities or inequalities of the rubbing surfaces, is called *friction*,—*which see*.—*Resistance* or *resisting force*, in *mech.*, denotes, generally, a force acting in opposition to another force so as to destroy it, or diminish its effect. It is a power by which motion, or a tendency to motion in any body, is retarded or prevented. Resistance is sometimes considered as of two kinds, *active* and *passive*, the first being that which corresponds to the useful effect produced by a machine, and the second that which arises from the inertia of the machine. *Solid of least resistance*, in *mech.*, the solid whose figure is such that in its motion through a fluid, it sustains the least resistance of all others having the same length and base; or, on the other hand, being stationary in a current of fluid, offers the least interruption to the progress of that fluid. In the former case it has been considered the best form for the stem of a ship; in the latter the proper form for the pier of a bridge. The problem of finding the solid of least resistance was first proposed and solved by Newton.

A problem may be divided into three parts—the proposition, the resolution, and the demonstration.—*Resolution of forces* or *of motion*, in *dynamics*, the dividing of any single force or motion into two or more others, which, acting in different directions, shall produce the same effect as the given motion or force. This is the reverse of *composition* of

forces or of motion. Thus let A B represent the quantity and direction of some given force; draw any lines A C, A D; and join C B, D B, and complete the parallelograms A D B E, A C B F. Then by composition of forces the force A B is equivalent to A D and A E, or to A C and A F. Hence it is evident that a given force, as A B, may be resolved into as many pairs of forces as there can be triangles described upon a given straight line A B, or parallelograms about it. And as the forces represented by A D, D B, or A C, C B, may also be resolved into other pairs of forces, it appears that by proceeding in the same manner with the successive pairs of forces, a given force may be resolved into an unlimited number of others, acting in all possible directions. [See *COMPOSITION, FORCE, RESULTANT*.]

RESPIRA'TION, *n.* [Fr. from L. *respiratio*.] 1. The act of breathing; the act of inhaling air into the lungs and again exhaling or expelling it, by which animal life is supported; the function by which the nutrient circulating fluid of an organized body is submitted to the influence of air for the purpose of changing its properties. The great end which appears to be answered by respiration is the removal of carbon, in the form of *carbonic acid*, from venous blood. This gas is accordingly found in the air which is expired from the lungs; and the blood having lost its carbonic acid, at the same time loses its dingy hue, and acquires, through the inhalation of oxygen from the air, the florid red which characterizes arterial blood. Respiration alternates with *inspiration*, which takes place about twenty-six times in a minute, thirteen cubic inches of air being the average quantity taken in at each inspiration. Respiration goes on in plants as well as in animals. The *respiration* of fishes, [for these cannot live long without air,] appears to be performed by the air contained in the water acting on the gills.—2. Relief from toil.

RESPIRATOR, or **RESPIRA'TOR**, *n.* An instrument for breathing through, fitted to cover the mouth, over which it is retained by proper bandages. 1. The art of speaking with propriety, elegance, and force.—2. The power of persuasion or attraction; that which allures or charms. We speak of the *rhetoric* of the tongue, and the *rhetoric* of the heart or eyes. In the widest sense in which the word is occasionally used by modern writers, it denotes the art of prose composition generally, whether in the form of historical works, philosophical dissertations, practical precepts, dialogues, or letters, and therefore includes the consideration of all the qualities of prose composition, as purity of style, structure of sentences, figures of speech, &c.; in short, the consideration of whatever relates to clearness, preciseness, elegance, and strength of expression. In the most restricted, and most etymological sense, the art of oratory or of addressing public assemblies. In an intermediate sense, in which, perhaps, it is most commonly employed, the art of argumentative composition. This comes nearest to the signification which Aristotle, the earliest extant writer of a formal treatise on rhetoric, attached to the title of his subject, where he defined it to be the art of discovering and employing topics of persuasion. Sweet silent *rhetoric* of persuading eyes.

When fused, it has a white colour and a metallic lustre. It is extremely hard, brittle, and has a sp. gr. of about 11. It unites with oxygen at a red heat, a mixture of peroxide and protoxide being formed. When pure, it is not acted upon by any acid; but if in the state of an alloy, it is dissolved by *aqua regia*. RHU'BARB, *n.* [Pers. *rawand*. In Syr. *raiborig*. It seems to be a compound word, Latinized *rhabarbarum*.] The common name of plants of the genus *Rheum* [see **RHEUM**], which yield the leaf-stalks used for making tarts, &c., and root used in medicine, so well known by the same name. There are, however, six well-marked varieties, viz., Russian

Many of them are used also for the purposes of dyeing and tanning; as an astringent principle, to which is frequently added an acid, is common to the whole genus. The juice of *R. toxicodendron*, the

poison-tree or poison-oak, is extremely poisonous. So also is the juice of *R. radicans*, or rooting poison-oak. *R. coriaria*, or elm-leaved Sumach, is extensively used for the purpose of tanning; *R. copallina*, gum-copal or mastic-leaved *Rhus*, is supposed to yield the gum-copal of commerce, from which copal-varnish is made. *R. vernicifera*, the varnish-bearing Sumach or Japan varnish-tree, yields a varnish used by the Japanese, and applied to furniture, and almost every thing made of wood. *R. venenata*, the poison Sumach or swamp Sumach, a native of North America, is exceedingly poisonous; so virulent that it is said to affect some persons by merely smelling it.

The Welsh word is rendered also, that divides or separates, and the Sax. *rim* seems to be connected with *room*, from opening, spreading. The deduction of this word from the Greek *ῥυθμος*, is a palpable error. The true orthography is *rime* or *ryme*; but as *rime* is hoarfrost, and *rhyme* gives the true pronunciation, it may be convenient to continue the present orthography.] 1. In *poetry*, the correspondence or consonance of sounds in the terminating words or syllables of two verses, one of which succeeds the other immediately, or at no great distance.

For rhyme with reason may dispense,
And sound has right to govern sense.

Prior.

To constitute this correspondence in single words or in syllables, it is necessary that the *vowel*, and the *final* articulations or consonants, should be the same, or have nearly the same sound. The initial consonants may be different, as in *find* and *mind*, *new* and *drew*, *cause* and *laws*.—2. An harmonical succession of sounds.

The youth with songs and rhymes,
Some dance, some haul the rope.

Denham.

In *poetry*, it is the relative duration of the moments employed in pronouncing the syllables of a verse; and in *music*, the relative duration of the sounds that enter into the composition of an air. *Prose* also has its *rhythm*, and the only difference (so far as sound is concerned) between verse and prose is, that the former consists of a regular succession of similar cadences, or of a limited variety of cadences, divided by grammatical pauses and emphases into proportional clauses, so as to present sensible responses to the ear, at regular proportioned distances; prose, on the other hand, is composed of all sorts of cadences, arranged without attention to obvious rule, and divided into clauses which have no obviously ascertained proportion, and present no responses to the ear at any legitimate or determined intervals. In *dancing*, the rhythm is recognised in the sound of the feet.

By this method only half the land is raised; the furrow being laid over quite flat, and covering an equal space of the level surface. It is called in Scotland *faughing*. A similar operation is still in use in some places, after land has been pulverized by clean ploughings, and is ready for receiving the seed, and the mode of sowing upon land thus prepared is also called *ribbing*.

Rice (Oryza sativa).

This plant is cultivated in all warm climates, and the grain forms a large portion of the food of the inhabitants in America, it grows chiefly on low

moist land, which can be overflowed. It is a light and nutritious food, and very easy of digestion. Indeed, it seems intended by the wise and benevolent Creator to be a common article of food for men in warm climates. There is an immense variety in the qualities of rice, but the rice raised on the low marshy grounds of Carolina is unquestionably very superior to any brought from any other quarter. Of the rice imported from the East, that from Patna is the most esteemed.

RIGHT, *a. rite.* [Sax. *riht, reht; G. recht; L. rectus*, from the root of *rego*, properly to strain or stretch, whence *straight; Sax. recan.*] Properly, strained; stretched to straightness; hence, 1. Straight, not crooked, direct; passing from point to point the shortest way.

A *right line* in geometry is the shortest line that can be drawn or imagined between two points. A *right line* may be horizontal, perpendicular, or inclined to the plane of the horizon. *Right angle, cone, cylinder, sphere, ascension*, &c. [See the respective nouns.]

2. In *morals and religion*, just; equitable; accordant to the standard of truth and justice or the will of God. That alone is *right* in the sight of God, which is consonant to his will or law; this being the only perfect standard of truth and justice. In social and political affairs, that is *right* which is consonant to the laws and customs of a country, provided these laws and customs are not repugnant to the laws of God. A man's intentions may be *right*, though his actions may be wrong in consequence of a defect in judgment.—3. Fit; suitable; proper; becoming. In things indifferent, or which are regulated by no positive law, that is *right* which is best suited to the character, occasion, or purpose, or which is fitted to produce some good effect. It is *right* for a rich man to dress himself and his family in expensive clothing, which it would not be *right* for a poor man to purchase. It is *right* for every man to choose his own time for eating or exercise. *Right* is a relative term; what may be *right* for one end, may be *wrong* for another.—4. Lawful; as, the *right heir* of an estate.—5. True; not erroneous or wrong; according to fact.

If there be no prospect beyond the grave, the inference is certainly *right*, "Let us eat and drink, for to-morrow we die." *Locke*.

6. Correct; passing a true judgment; not mistaken or wrong. You are *right*, justice, and you weigh this well. *Shak.*

7. Not left, but its opposite; most convenient or dextrous; strong or stronger, with reference to something else; as, the *right hand*, which is generally most strong or most convenient in use. [See RIGHT HAND.] 8. Most favourable or convenient.

hand of a person whose face is toward the mouth of a river; as, the *right bank* or Kent side of the Thames.

RIGHT, *adv.* In a right or straight line; directly.

You with strict discipline instructed *right*. *Roscommon.*

4. According to fact or truth; as, to tell a story *right*.—5. In a great degree; very; as, *right humble; right noble; right valiant.* [Obsolescent or inelegant.] 6. It is prefixed to titles; as, in *right* honourable; *right* reverend.

RIGHT, is used elliptically for *it is right, what you say is right, it is true, &c.*

Right, cries his lordship. *Pope.*

[In this sense, however, it may be considered as an approbatory interjection.] *On the right*, on the side with the right hand.

RIGHT, *n.* Conformity to the will of God, or to his law, the perfect standard of truth and justice. In the literal sense, *right* is a straight line of conduct, and *wrong* a crooked one. *Right* therefore is rectitude or straightness, and perfect rectitude is found only in an infinite Being and his will.—2. Conformity to human laws, or to other human standard of truth, propriety, or justice. When laws are definite, *right* and *wrong* are easily ascertained and understood. In arts, there are some principles and rules which determine what is *right*. In many things indifferent, or left without positive law, we are to judge what is right by fitness or propriety, by custom, civility, or other circumstances.—3. Justice; that which is due or proper; as, to do *right* to every man.

Long love to her has borne the faithful knight, And well deserved, had fortune done him *right*. *Dryden.*

4. Freedom from error; conformity with truth or fact.

Seldom your opinions err, Your eyes are always in the *right*. *Prior*.

5. Just claim; legal title; ownership; the legal power of exclusive possession and enjoyment. In hereditary monarchies, a *right* to the throne vests in the heir on the decease of the king. A deed vests the *right* of possession in the purchaser of land. Right and possession are very different things. We often have occasion to demand and sue for *rights* not in *possession*.—6. Just claim by courtesy, customs, or the principles of civility and decorum. Every man has a *right* to civil treatment. The magistrate has a *right* to respect.—7. Just claim by sovereignty; prerogative. God, as the author of all things, has a *right* to govern and dispose of them at his pleasure.—8. That which justly belongs to one.

We deem the *right* of trial by jury invaluable, particularly in the case of crimes. *Rights* are natural, civil, political, religious, personal, and public.—11. Authority; legal power.

The police have a *right* to arrest malefactors.—12. In the *United States*, a tract of land; or a share or proportion of property, as in a mine or manufactory.—13. The side opposite to the left; as, on the *right*. Look to the *right*.—*Right side of a roadway or water way*, the proper side on which to pass. A vehicle or vessel overtaking another should pass on the right hand side, when meeting another it should pass on the left hand side.—*Right side of a foot-path*, the side on which the pedestrian ought to walk, being always the one on his right hand.—*Right* in law, includes not only every right for which a writ of right lies, but also any title or claim by virtue of a condition, mortgage, &c. for which no action is given by law, but only an entry. There is a *right of property, a right of possession, a right both of property and possession, a present and a future right*, &c. In *Scots law*, rights are divided into *heritable and moveable*.—*To rights*, in a direct line; straight. [Unusual.]

2. Directly; soon.—*To set to rights, or to put to rights*, to put into good order; to adjust; to regulate what is out of order.—*Bill of rights*, a list of rights; a paper containing a declaration of rights, or the declaration itself. Specially, the declaration delivered by the two houses of parliament to the Prince of Orange, Feb. 13, 1688; in which, after a full specification of various acts of James II, which were alleged to be illegal, the rights and privileges of the people were asserted.—*Right of property, in pol. econ.*, the right which states, bodies of individuals, and individuals, have to use and enjoy such lands, natural powers, and products, as have been appropriated and set apart.—*Right of way*, a liberty of passage along roads, streets, footpaths, &c., vested in the public or individuals by statute or common law, prescription, or private agreement.

The proper origin of a private *right of way* is, a grant from the owner of the soil, whose means of enjoying his own property are abridged thereby. *P. Ency.*

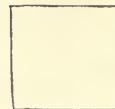

In *England*, the act 2 and 3 Wm. 4, c. 71, modified the *right of way*. In *Scotland*, it is generally constituted by forty years' prescription; and when the public have been in the uninterrupted use of such road or footpath for such a period, or from time immemorial, the proprietor cannot shut it up or create an obstruction. Such are kirk or market roads, footpaths along the banks of rivers, &c.—*Writ of right*, a writ which lies to recover lands in fee simple, unjustly withheld from the true owner.

RIGHTEOUS, *a.* (ri'chus.) [Sax. *riht-wise*; *right* and *wise*, manner, as in *otherwise*, *lengthwise*.] 1. Purity of heart and rectitude of life; conformity of heart and life to the divine law. *Righteousness*, as used in scripture and theology, in which it is chiefly employed, is nearly equivalent to holiness, comprehending holy principles and affections of heart, and conformity of life to the divine law. It includes all we call justice, honesty, and virtue, with holy affections; in short, it is true religion.—2. *Applied to God*, the perfection or holiness of his nature; exact rectitude; faithfulness.—3. RIGHT HAND, *n.* The hand opposite to the left, usually the most employed, the strongest, most convenient or dextrous hand, and hence its name in other languages, as well as in ours.—In *scripture*, the *right hand* denotes power or strength, and God's *right hand* is generally used to denote the effects of his omnipotence.—*To seat a person at the right hand*, is in scripture language a token of peculiar honour, and when Christ is said to be seated at God's *right hand*, it imports unequalled dignity and exaltation.

The primary sense is probably to strain or extend.] 1. Stiff; not pliant; not easily bent. It is applied to bodies or substances that are naturally soft or flexible, but not fluid. We never say, a *rigid* stone, or *rigid* iron, nor do we say, *rigid* ice; but we say, an animal body or limb, when cold, is *rigid*. *Rigid* is then opposed to *flexible*, but expresses less than *inflexible*.—A *rigid body*, in *mech.*, is one which resists any change of form when acted on by any force or forces. In all theoretical investigations respecting the application of forces through the intervention of machines, those machines are assumed (except cords) to be perfectly rigid, so far as the forces employed are able to affect their integrity of form and structure. *Rigidity* in the arts is often called *stiffness*, and is opposed to flexibility. The *rigidity of cords*, or the difficulty with which they are bent into any given curve, is the chief cause of the loss of power arising from their employment in machines. The force necessary to bend a rope is directly as its diameter, directly as the tension, and inversely as the diameter of the pulley or axle round which it is wound.—2. A brittle hardness, as opposed to *ductility*, *malleability* and *softness*.—3. Stiffness of appearance or manner; want of ease or airy elegance.—4. Strictness; severity. Newton first supplied a careful examination of these coloured rings, and in explanation of their phenomena, he invented his theory of "Fits of easy transmission and of easy reflection of light." The systems of coloured rings produced by transmitting polarized light through transparent bodies that possess double refraction, are the most brilliant phenomena that can be exhibited. Thus we never say, the price of goods arises, when we mean advances, but we always say, the price rises. We never say, the ground arises to a certain altitude, and rarely, a man arises into an office or station. It is hardly possible to class or define the cases in which usage has established a difference in the orthography of this verb. A knowledge of these cases must be acquired by observation.

In Portuguese, *risco* signifies not only hazard, but a stroke, a dash, and with painters, delineation; *risicar* signifies to dash or strike out with a pen, to erase. The primary sense then is to throw or dash, or to rush, to drive forward. See PERIL, RASH, and RUSH.]

—1. Hazard; danger; peril; exposure to harm. He, at the risk of his life, saved a drowning man.—2. In *com.*, the hazard of loss, either of ship, goods, or other property. Hence, *risk* signifies also the degree of hazard or danger; for the premiums of insurance are calculated upon the risk. The underwriters now take risks at a low premium. In the theory of probabilities, the risk of loss or gain signifies such a fraction of the sum to be lost or gained,

as expresses the chance of losing or gaining it; thus, an even chance of losing £40 is considered as a positive loss of one-half of £40, or of £20; and 2 to 1 of gaining £60 is counted as two-thirds of £60 or £40. If both these risks were encountered at the same time, the whole transaction would be considered as a gain of £40—£20, or £20, since this is the sum which would be netted by every such transaction in the long run, and one with another.—*To run a risk*, is to incur hazard; to encounter danger.

RIVER, *n.* One who rives or splits.

RIVER, *n.* [*Fr. rivière; It. riviera; from L. rivus, rivulus; D. rivier.* The Italian word signifies a river, and a bank or shore, *L. ripa.*] 1. An inland current of water formed within a certain portion of the earth's surface by the confluence of brooks, small streams, or mountain torrents, and discharging itself into the ocean, a lake, marsh, or other river. The country which is drained by a river is called its basin, as the river runs in the lowest part of it. A *brook* is the name given to rivers of the smallest description, and if the waters should be increased by those of another brook, the name of brook is changed into that of *rivulet*. When several rivulets unite and so produce a considerable volume of running water, this water-course takes the name of *river*. But all such rivers do not

reach the sea or even a lake; most of them join other rivers, and thus a large river is produced. This last mentioned river is called the *principal river*, and those which increase its waters are called, with respect to it, *affluents* or *tributaries*, and sometimes *feeders* or *branches*. The first waters of a river are generally derived from a spring which breaks out at the foot of a declivity or on the side of some hill or mountain, and sometimes from a swamp or lake. This is called the *source* of a river. From this source the river descends through the lowest part of its basin until it terminates its course in the sea, a lake, or another river, and this termination is called the *mouth* of the river. The cavity in which the running water flows is called the *bed* of the river, and the solid land which bounds this bed is called its *banks*. Most large rivers have their origin in very elevated mountains, or on high table-lands, in descending from which, a great difference with respect to the rapidity of their course, and the nature of the country through which they flow, is observed accordingly by geographers, who divide the whole of the course of such rivers into three divisions, the *upper*, *middle*, and *lower* course. Most rivers overflow the low countries which are adjacent to their banks, either at regular seasons of the year or occasionally. This takes place when the supply of water is greater than the bed of the river can contain. The periodical inundations depend on great falls of rain in mountainous regions, or on the melting of snow and ice in the neighbourhood of their source. The period depends on the return of these seasons in different places. The largest rivers in the world are the Amazon and La Plata, in South America; the Mississippi, Missouri, and St. Lawrence, in North America; the Yang-tze-kiang, the Hoanho, the Lena, the Ganges, the Indus, and the Euphrates, in Asia; the Nile and the Niger, in Africa; and the Volga, the Danube, and the Rhine, in Europe. In a *legal* sense, rivers are divisible into *fresh* and *salt-water* rivers. Salt-water rivers are those rivers, or parts of rivers, in which the tide ebbs and flows. Rivers are also divisible into *public* or *navigable* rivers, and *private* rivers.—2. A large stream; copious flow; abundance; as, *rivers* of blood; *rivers* of oil.—3. In *hydraulics*, a current of water flowing in an open channel. The velocity of a current of water flowing in an open channel depends on the volume of water, the form of the channel, and its inclination; and the determination of the relations subsisting among these three quantities is a problem of great practical importance, the solution of which must be derived partly from experiment, and partly from the general theory of the motion and resistance of fluids.

It is in this manner that boilers and tanks are made.

1. A bird of the genus *Corvus*, the bird mentioned by Virgil under this name, the *C. frugilegus*, Linn. In crows also the nostrils and root of the bill are clothed with feathers, but in rooks the same parts are naked, or have only a few bristly hairs. The rook is content with feeding on the insect tribe (particularly the larvae of the cock-chaffer), and on grain; and there can be no doubt that it amply repays the farmer for the seed it takes, by its assiduity in clearing the land of wire-worms and the destructive grub. Rooks are gregarious at all seasons, resorting constantly to the same trees every spring to breed, when the nests may be seen upon the upper branches. They are spread over the greater part of Europe; but no where do they seem to be more abundant than in Great Britain and Ireland.—2. A cheat; a trickish, rapacious fellow.

That part of a plant which enters and fixes itself in the earth, and serves to support the plant in an erect position, while by means of its radicles, it imbibes nutriment for the stem, branches and fruit. There are six distinct organs which are capable of entering into the composition of a root, viz. the *radicle*, the *fibril*, the *soboles*, the *bulb*, the *tuber*, and the *rhizoma*. Roots receive different names according to their structure, forms, and positions; as branched, bulbiferous, fibrous, horizontal, oblique, simple, tapering, vertical, &c.—2. The part of any thing that resembles the roots of a plant in manner of growth; as, the *roots* of a cancer, of teeth, &c.—3. The bottom or lower part of any thing.

Deep to the *roots* of hell. *Milton*.

They were the *roots* out of which sprung two distinct people. *Locke*.

7. In *arith.* and *alge.*, the root of any quantity is such a quantity as, when multiplied into itself a certain number of times, will exactly produce that quantity. Thus 2 is a root of 4, because when multiplied into itself, it exactly produces 4. The power is named from the number of the factors employed in the multiplication, and the root is named from the power. Thus if a quantity be multiplied once by itself, the product is called the second power or square, and the quantity itself the *square root*, or second root of the product; if the quantity be multiplied twice by itself we obtain the third power, or cube, and the quantity is the *cube root* or third root, and so on. The algebraic sign of a root is $\sqrt{\quad}$, and the particular root is indicated by placing above the sign the figure which expresses the number of the root, which figure is called the index of the root. Thus $\sqrt[4]{16}=2$, indicates the fourth root of 16; $\sqrt[4]{4}$ or $\sqrt[4]{4}=2$, the square root of 4. The same is the case with algebraic quantities, as $\sqrt[3]{a^3+3a^2b+3ab^2+b^3}=a+b$. [See POWER, INDEX, INVOLUTION, EVOLUTION.] *Root* of an equation, in *alge.*, the value of the unknown quantity which enters into the equation. [See EQUATION.]—8. Means of growth. Indeed the smaller *ropes*, when used for certain purposes, are called *lines*.—*Ropes* are, by seamen, ranked under two descriptions, *cable-laid* and *hawser-laid*; the former composed of nine strands, or three great strands, each consisting of three small ones; the latter made with three strands, each composed of a certain number of rope-yarns.—2. When the rope is to be tarred, that operation is usually performed upon the yarns immediately after their being warped. A suitable number of yarns are next formed into a strand, and three or more such strands are afterwards combined into a rope. The twist of the strand is in an opposite direction to that of the yarns of which it is composed, in order that the tendency to entwine in one part may counteract the like tendency in another.

ROTA'TION, *n.* [*L. rotatio, from roto, to turn*; *rota, a wheel.*] 1. The act of turning; the motion of a solid body, as a wheel or sphere, about an axis, as distinguished from the progressive motion of a body revolving round another body or a distant point. Thus the daily turning of the earth on its axis is a *rotation*; its annual motion round the sun is a *revolution*. The determination of the circumstances of the rotation of a planet about its axis, is an important problem in physical astronomy; and also in relation to practical mechanics, the problem of rotation is of great importance, inasmuch as it comprehends the methods of computing the performance of machines, the forces necessary to overcome their inertia, and the proper relations and most advantageous dispositions of their several parts, in order that the required effect may be produced by the smallest expenditure of power, and the least strain or injury to the machine itself.—*Axis of rotation*, the axis or line about which a revolving body turns.—*Principal axes of rotation*: if a point, which is not the centre of gravity, be taken in a solid body, all the axes which pass through that point (and they may be infinite in number) will have different moments of inertia, and there must exist one in which the moment is a maximum, and another in which it is a minimum. Those axes, in respect of which the moment of inertia is a maximum or minimum, are called the *principal axes of rotation*. In every body, however irregular, there are three principal axes of rotation, at right angles to each other, on any one of which, when the body revolves, the opposite centrifugal forces counterbalance each other, and hence the rotation becomes permanent.—*Centre of rotation*, the point about which a body revolves. It is the same as the centre of motion.—*Centre of spontaneous rotation*, the point about which a body, all whose parts are at liberty to move, and which has been struck in a direction not passing through its centre of gravity, begins to turn. If any force is impressed upon a body or system of bodies, in free space, and not in a direction passing through the centre of gravity of the body or system, a rotatory motion will ensue about an axis passing through the centre of gravity, and the centre about which this motion is performed is called the *centre of spontaneous rotation*.—*Angular velocity of rotation*; when a solid body revolves about an axis, its different particles move with a velocity proportional to their respective distances from the axis; and the velocity of the particle whose distance from the axis is unity, is the *angular*

velocity of rotation.—*Rotation in bot.*, is the movement of fluids in the cells of some plants, as *chara* and *vallisneria*. The movements take place in a spiral manner, and are seen under the microscope by means of the small granular bodies which are carried along by the currents.—*Rotation of crops, in agriculture and gardening*, the mode in which different kinds of crops are made to succeed each other in the same field or plot. It is found that the same annual crop cannot be advantageously cultivated on the same soils for more than one or two years, and hence one kind of crop is made to succeed another. But as the number of cultivated crops is limited, when the whole course has been gone through once, it is again repeated; and hence the origin of the word *rotation* as applicable to crops. The same number and kind of crops, however, are not always grown in regular succession, but a change is frequently made according to general principles, and the term used in that case is *succession of crops*. Different soils and climates require different systems of rotation; but it is a recognized rule in all cases, that culmiferous crops ripening their seeds, should not be repeated without the intervention of pulse, roots, herbage, or fallow.—2. Vicissitude of succession; the course by which officers or others leave their places at certain times, and are succeeded by others.

ROTATIVE, *a.* Turning, as a wheel; rotary. [*Little used.*]

ROTATORIES, or **ROTATORIA**, *n.* [L. *rota*, a wheel.] A section of infusorial animals. [*See ROTIFERS.*]

ROTATORY, *a.* [from *rotator*.] Turning on an axis, as a wheel; rotary.—2. Going in a circle; following in succession; as, *rotatory assemblies*.—[This word is often used, probably by mistake, for *rotary*. It may be regularly formed from *rotator*, but not with the exact sense in which it is used. With *rotator* for its original, it would signify *causing*, rather than *being* in a circular motion. The true word is *rotary*.]—*Rotatory, or Rotary steam-engine*, an arrangement of mechanism, by which the elastic force of steam is employed to obtain motion round an axis, without the intervention of reciprocating parts. In the majority of cases in which the steam-engine is used as a source of power, it is for the production of motion in the state referred to, and it has been naturally inferred by many, that by simply causing the steam to act directly upon surfaces rigidly connected with the shaft to be set in motion, the most powerful effect would be produced, and in the most economical manner. Numerous plans have been proposed for carrying this into effect, but, however unobjectionable in theory, the practical difficulties to be contended with have hitherto been found to be so great, that no efficient rotatory engine has as yet been invented, which can at all come into competition with the ordinary reciprocating engine.

ROTE, *n.* [a contraction of *crowd*, W. *cruth*, Ir. *crui*.] An old musical instrument, played with a wheel; a sort of hurdy-gurdy.

ROTE, *n.* [L. *rota*, a wheel, whence Fr. *routine*.] Properly, a round of words; frequent repetition of words or sounds, without attending to the signification, or to principles and rules; a practice that impresses words in the memory, without an effort of the understanding, and without the aid of rules. Thus children learn to speak by *rote*; they often repeat what they hear, till it becomes familiar to them. So we learn to sing by *rote*, as we hear notes repeated, and soon learn to repeat them ourselves.

ROTE, *v. i.* To fix in the memory by means of frequent repetition ourselves, or by hearing the repetition of others, without an effort of the understanding to comprehend what is repeated, and without the aid of rules or principles. [*Little used.*]

RUSH, *n.* [*Sax. rics* or *risc*; probably *L. ruscus*. The Swedish corresponding word is *saf*, the Hebrew כִּיס, *sâph*, usually rendered sea-weed, and applied to the Arabic gulf; Deut. i. 1; Numb. xxi. 14. This correspondence deserves notice, as illustrating certain passages in the Scriptures.] 1. The common name of the species of *Juncus*, a genus of plants, nat. order Juncaceæ. The genus is distinguished by its inferior perianth, composed of six glumaceous leaves; its three-celled, three-valved capsules; the seed-bearing dissepiments of the valves being in their middle. The species are numerous, and found chiefly in moist boggy situations in the colder parts of the world. *J. effusus*, the soft rush, and *J. conglomeratus*, the common rush, are used in many parts of the country for plaiting into mats, chair bottoms, and for constructing small toy baskets. The wicks also of the candles, called rush-candles, are made from the pith, as also the wicks of common lamps. Twenty species of rush are enumerated by British botanists, including the two above mentioned. Various species are frequently very troublesome weeds in agriculture. The term *rush* is however applied to plants of various other genera beside *Juncus*, and by no means to all of the genus

It was formerly raised in considerable quantities as a bread corn in England, but now it is mostly sown as a green crop for food to sheep and cattle in spring. In the Netherlands, it is the chief grain from which the spirit called Hollands is distilled, and when malted it makes excellent beer. Two parts of wheat and one of rye ground together make an excellent bread. Rye straw is use-

S

S THE nineteenth letter of the English Alphabet, is a sibilant articulation, and numbered among the semivowels. It represents the hissing made by driving the breath between the end of the tongue and the roof of the mouth, just above the upper teeth. It has two uses; one to express a mere hissing, as in *sabbath*, *sach*, *sin*, *this*, *thus*; the other a vocal hissing, precisely like that of *z*, as in *muse*, *wise*, pronounced *muze*, *wize*. It generally has its hissing sound at the beginning of all proper English words, but in the middle and end of words, its sound is to be known only by usage. In a few words it is silent, as in *isle* and *viscount*. In abbreviations, S. stands for *societas*, society, or *socius*, fellow; as, F. R. S. fellow of the Royal Society. S. or St. for *saint*; S. or Sec. for *seconds*; Sec. for *secretary*; S. or Sh. for *shillings*. S. T. P. for *sanctæ theologiæ professor*, professor of sacred theology. In medical prescriptions, S. Hence it is often called the *Lord's day*. The most simple and obvious kind of safety-valve is that in which a weight is placed directly over a steam-tight plate, fitted to an aperture in the boiler. When, however, the pressure is high, this form becomes inconvenient, and the lever safety valve is adopted. This form is represented in fig. 1,

Bastard saffron, a plant of the genus *Carthamus*, the *C. tinctorius*. It is cultivated in China, India, Egypt, and also in the South of Europe, on account of its flowers, which in their dried state form the safflower of commerce. An oil is expressed from the seeds, which is used by the Asiatics as a laxative medicine. It is also most extensively used as a lamp oil. The dried flowers afford a red colour, exceeding in delicacy and beauty, as it does in costliness. It is principally employed for imitating upon silk the fine scarlet, (*ponceau*) of the French, and rose colours dyed with cochineal upon woollen cloth. Safflower also produces the beautiful *rouge* known by the name of *rouge végétale*. Safflower from China is the most valued.

The dried stigmata form the saffron of the shops, which, when good, has a sweetish, penetrating, diffusive odour; a warm, pungent, bitterish taste; and a rich, deep orange colour. Saffron is used in medicine and the arts, but in this country the consumption seems to be diminishing. It is also employed in cookery and confectionary, to colour butter and cheese, and by painters and dyers. It is chiefly imported from the south of Europe, especially Spain, but the English saffron, as being of a superior quality, is always preferred. It is often adulterated with the petals of other plants, especially with those of the marigold. The *bastard saffron* is of the genus *Carthamus*, and the *meadow saffron* of the genus *Colchicum*.

Sago Palm (*Sagus genuina*.)

100 to 800 lbs. of sago. The tree when at maturity is about 30 feet high, and from 18 to 22 inches in diameter. The sago or medullary matter, which is prepared by the plant for the use of the flowers and fruit, is most abundant just before the evolution or appearance of the spadix or flower-bud. At this period the tree is cut down and the medullary part extracted from the trunk, and reduced to powder like sawdust. The filaments are next separated by washing, and the meal laid to dry. For exportation, the finest sago meal is mixed with water, and then rubbed into small grains of the size and form of coriander seeds. This is the kind

principally brought to England. Of late years the Chinese have invented a process for refining sago, and giving it a fine pearly lustre; the sago so cured is in the highest estimation in all the European markets. several breadths of canvas, [or some substitute for it,] sewed together with a double seam at the borders, and edged with a cord called the bolt-rope, to be extended on the masts or yards for receiving the impulse of wind by which a ship is driven. A sail extended by a yard hung (*stung*) by the middle and balanced, is called a *square sail*; a sail set upon a gaff or a stay, is called a *fore and aft sail*; which terms refer to the position of the yard, gaff, or stay, when the sail is not set. The upper part of every sail is the *head*, the lower part the *foot*, the sides in general are called *leeches*; but the weather or side edge of any but a square sail is called the *luff*, and the other edge the *after leech*. The upper two corners are *earings*, but that of a jib is the *head*; the lower two corners are in general *clues*; the weather clue of a fore and aft sail, or of a course while set, is the *tack*. The edges of a sail are strengthened by a rope called the *bolt rope*. Sails take their names from the mast, yard, or stay upon which they are stretched. Thus the sails connected with the main mast are the *main-sail*, *main-top-mast sail*, *main-top-gallant sail*, and the *main-royal*. In like manner there are the *fore sail*, the *fore-top sail*, the *fore-top-gallant sail*, and the *fore-royal*; and similar appellations are given to the sails supported by the *mizzen* or *after-mast*. The *main-stay sail*, *main-top-mast-stay sail*, &c., are between the main and fore masts, and the *mizzen-stay sail*, *mizzen-top-mast stay sail*, &c., are between the main and mizzen-masts. SAL'IE, or **SAL'IQUE**, *a.* [Fr. *salique*.] The etymology is uncertain. The most reasonable French philologists derive it from the Salieni, a surname of the Franks, who lived about the river Saale in ancient Germany. Echard deduces this word from *sala*, a house, and the law, from the circumstance that a male only could inherit his father's mansion and the court or land inclosed. *Montesq. b. 18.*] The Salic law of France was a fundamental pact, by virtue of which males only could inherit the throne.

The radical sense is, probably, pungent, and if *s* is radical, the word belongs to the root of L. *salio*; but this is uncertain.] 1. Common salt is the chloride of sodium, formerly termed muriate of soda, a substance which has been known, and in common use, as a seasoner and preserver of food from the earliest ages. It is formed when chlorine and sodium or hydro-

chloric acid and soda come together. It possesses a crystalline structure, derived from the cube which is its primitive form. When in a state of purity it consists of 60 of chlorine, and 40 of sodium, in 100 parts. It is found in immense quantity dissolved in sea water, and in the water of salt springs, and in smaller quantity in all natural waters, by which, indeed, it is carried to the sea, where it accumulates. Salt is also found abundantly, as rock salt, in various countries, from fossil beds, or, as they are termed, salt mines, which are situated between the coal formation and the lias. It is obtained from sea water by simple evaporation, either spontaneous, or with the aid of heat; but immense quantities are obtained from the salt mines in the neighbourhood of Northwich, in Cheshire, and the salt springs in Cheshire and Worcestershire furnish a large proportion of the salt made use of in Great Britain. One chief use of salt is as an antiseptic in curing meat, but its most important use is as a condiment to food, or rather as a substance indispensable to digestion. It is also employed to yield hydrochloric acid, and chlorine for the making of bleaching powder, as well as the best carbonate of soda. It forms a glaze for coarse pottery; it improves the whiteness and clearness of glass; it gives hardness to soap; it is used as a mordant, and for improving certain colours; and enters more or less into many other processes of the arts.—2. In *chem.*, a term applied to all combinations of acids with alkaline or salifiable bases. The term has also been extended to certain binary combinations of chlorine, iodine, bromine, and fluorine, with the metals, and these have been termed *haloid salts*. [See HALOID.] Certain definite combinations of the sulphurets with each other, have of late been called *sulphur salts*. Turner, in his *Chemistry*, groups together all saline compounds which have a certain similarity of composition into one great class of *salts*, which he divides into the four following orders:—1. The oxy-salts. This order includes no salt the acid or base of which is not an oxidized body; as for example, when sulphuric acid unites with soda, the result being sulphate of soda. 2. The hydro-salts. This order includes no salts, the acid or base of which does not contain hydrogen. 3. The sulphur-salts. This order includes no salt, the electro-positive or negative ingredient of which is not a sulphuret. Such salts are, in this country, generally classed together as double sulphurets: thus, copper pyrites; or double sulphuret of iron and copper, is a sulphur-salt. 4. The haloid salts. This order includes no salt the electro-positive or negative ingredient of which is not haloid: thus, the whole series of the metallic chlorides, iodides, bromides, and fluorides, are *haloid salts*. Salts have been conveniently, though not quite correctly, divided into alkaline, earthy, and metallic salts; for, strictly speaking, most of the two former belong to the latter, and to these classes must be added ammoniacal salts, and the salts of the vegetable alkalies. The nomenclature of salts has reference to the acids which they contain. For example, *sulphates, nitrates, carbonates*, &c., imply salts of the sulphuric, nitric, and carbonic acids. The termination

ate implies the maximum of oxygen in the acids, and *ite* the minimum. If neither the acid nor base of a salt be in excess, it is termed a *neutral salt*; if the acid predominate, it is called an *acid salt*, a *bi salt*, or a *super salt*, and if the base prevail, it is called a *basic salt*, or a *sub-salt*. Many salts are *hydrous*, that is, they contain a definite proportion of water of crystallization; others are dry or *anhydrous salts*. Some salts attract moisture when exposed to air, and are called *deliquescent*; others suffer their water to escape, and become opaque or pulverulent: these are called *efflorescent salts*. The combination of salts with each other gives rise to compounds called *double salts*; as the sulphate of lime and soda, the boro-fluoride of potassium, &c. Most of the double salts hitherto examined consist of the same acid and two different bases. The neutral state of salts is commonly indicated by their solutions not changing the colours of litmus, violets, or red cabbage; the sub-state of salts, by their turning the colours of violets and cabbage into green; and the super-state of salts, by their changing the purple of litmus, violets, and cabbage into red; but to the generality of this criterion there are some exceptions. According to the views of modern chemists, all true acids are hydrogen compounds, and all their salts compounds of metals with radicals, simple or compound. Hence they define an acid to be "the hydrogen compound of a simple or compound radical, possessing the power of neutralizing bases;" and a salt, "the compound formed by replacing the hydrogen of an acid by a metal."—3. SAND, *n.* [Sax. *sand*; G. Sw. and Dan. *sand*; D. *zand*.] 1. Any mass or collection of fine particles of stone, particularly of fine particles of silicious stone, but not strictly reduced to powder or dust. A mass of any comminuted minerals is, in popular language, called sand, but the most abundant ingredient in the extensive sands of the deserts is granular quartz, or flint. Most of the sands which we observe, whether on the surface of the ground, or in strata at a certain depth, whether forming the beds of rivers or the shores of the sea, are the ruins of disintegrated rocks, and are red, white, grey or black, according to the rocks from which they were derived, such as granitic, porphyritic, and other pyrogenous rocks. Soil often contains sand, though the subjacent strata be wholly calcareous or finely argillaceous.

Valuable metallic ores, as those of gold, platinum, tin, copper, iron, titanium, often occur in the form of sand or mixed with that substance. Pure silicious sands are very valuable for the manufacture of glass, for making mortars, filters, ameliorating dense clay soils, for making moulds in founding, and many other purposes.—2. *Sands*, in the plural, tracts of land consisting of sand, like the deserts of Arabia and Africa, as the Libyan *sands*.

When the sandal tree becomes old, the harder central wood acquires a yellow colour and great fragrance, while the softer exterior wood remains white and destitute of fragrance. The former is what is called yellow sandal wood, and the latter white sandal wood. Some botanists, however, are of opinion that the yellow sandal wood is the produce of a

different tree. It is the yellow wood only, which is highly esteemed for its perfume, and which is considered so valuable for musical instruments, boxes, cabinets, &c. This article grows chiefly on the coast of Malabar and in the Indian Archipelago. [See **SANTALUM**.] *Red sandal wood*, or *Red sanders Wood* is the produce of a tree of the genus *Pterocarpus*, the *P. santalinus*, a native of India. It is used as a dye-wood, and as a slight astringent in medicine. In India, it is employed, along with one-tenth of Sapan wood, principally for dyeing silk and cotton. The colouring principle is called *Santaline*. [See **PTEROCARPUS**.]

It is used in powder, and mingled with a little chalk, to prevent ink from sinking or spreading on paper. This is the substance denoted by the Arabic word, and it is also called *varnish*, as it enters into the preparations of varnish. [See **POUNCE**.]—2. SAN'D'STONE, *n.* [*sand* and *stone*.] Stone composed of agglutinated grains of sand, which may be calcareous, silicious, or of any other mineral nature. Sandstone is in most cases chiefly composed of particles of quartz, united by a cement. The cement is in variable quantity, and may be calcareous or marly, argillaceous, or argillo-ferruginous or even silicious. The grains of quartz are sometimes scarcely distinguishable by the naked eye, and some-

'mes are equal in size to a nut or an egg; as in those sandstones called *conglomerates*, and sometimes pudding stone or breccia. The texture of some sandstones is very close, while in others it is very loose and porous. Some sandstones have a slaty structure, and have been called sandstone slate. In colour sandstone varies from gray to reddish brown, in some cases uniform, in others variegated. In addition to quartz, some sandstones contain grains of feldspar, flint, and silicious slate, or plates of mica. Some sandstones are ferruginous, containing an oxide or the carbonate of iron. Sandstone, though a secondary rock, has been formed at different periods and under different circumstances, and is hence associated with different rocks or formations. It is in general distinctly stratified, and the beds horizontally arranged, but sometimes they are much inclined, or even vertical. The strata of the new red sandstone are found lying immediately above the coal measures. It is a conglomerate. The old red sandstone forms the lowest member of the carboniferous group, and lies above the silurian rocks. It consists of many varieties and alternations of silicious sandstones and conglomerates of various colours, red predominating. It sometimes contains metallic substances, disseminated through the mass, or in beds or veins. Among these are sulphurets of iron, mercury, lead, and copper, and arsenical cobalt. Various organic remains occur in sandstone, among which are reeds, impressions of leaves, trunks of trees, and shells, both fluviatile and marine. Sandstone in some of its varieties is very useful in the arts, and is often known by the name of *freestone*. When sufficiently solid it is employed as a building stone. Some varieties are used as mill-stones for grinding meal, or for wearing down other materials preparatory to a polish, and some are used for whetstones.

SAP, *n.* [Sax. *sæp*; G. *sift*; Fr. *seve*; Arn. *sabr*; probably from softness or flowing. Qu. Pers. *zabah*, a flowing.]

1. The juice of plants of any kind. The fluid which plants imbibe from the soil in which they are placed, and the great source from which they are nourished, and their various peculiar secretions

produced. The constituents of sap may be divided into those which are necessary for the growth of all plants, which are carbon, oxygen, hydrogen, and nitrogen; and those which are necessary only for the growth of particular plants or families of plants, such as the oxides of potassium, sodium, calcium, and magnesium. The sap is absorbed by the roots from the soil and then sent upwards into the stem towards the leaves. It is afterwards conveyed back from the leaves, when it is assimilated and altered, to the bark. In its crude state it consists of little except water holding earthy and gaseous matter in solution; especially carbonic acid; but as it rises through the tissue of the stem, it dissolves the secretions it meets with in its course, and thus acquires new properties, so that by the time it reaches the leaves it is entirely different from its state when it first enters the root. It is not certainly known through what kind of tissue the upward motion of the sap takes place, but it is most probable that all the tissues of a plant are engaged in conveying sap, with the exception of the spiral vessels, which seem appropriated to the conveyance of air. The sap, on arriving in the leaves, undergoes a diminution of its mass by the exhalation of a great part of the water which served as the vehicle of the nutritious substances contained in it. The remaining portion undergoes a further change by respiration. The sap, thus altered by respiration in the leaves and other green parts, descends into the stem and root, and is rendered subservient to the development of all the organs. *See RESPIRATION, TRANSPIRATION, FOOD, NUTRITION.*—2. The albumen of a tree; the exterior part of the wood, next to the bark.—[*A sense in general use.*]

SAW, *v. t. pret. sawed*; *pp. sawed* or *sawn*. [G. *sägen*; It. *segare*, to saw, cut, reap; *L. seco*; *Fr. scier*; allied to *sichle*.] 1. To cut with a saw; to separate with a saw; as, to *saw* timber or marble.—2. To form by cutting with a saw; as, to *saw* boards or planks; that is, to *saw* timber into boards or planks.

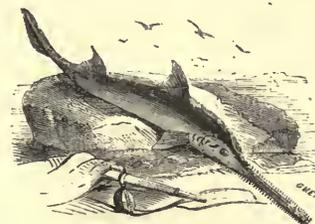

SAW, *v. i.* To use a saw; to practise sawing; as, a man *saws* well.—2. To cut with a saw; as, the mill *saws* fast or well.—3. To be cut with a saw; as, the timber *saws* smooth.

SAW-FISH, *n.* A fish of the genus

Saw Fish (*Pristis cirratus*).

Pristis, belonging to the fixed-gilled

chondropterygians, nearly related, on the one hand, to the sharks, and on the other, to the rays. It has a long beak or snout, with spines growing like teeth on both edges, and four or five spiracles or breathing holes in the sides of the neck.

SAW'-FLY, *n.* A genus of flies, (*Tenthredo* of Linn.) belonging to the modern family Tenthredinidae, distinguished by their large wings with many cells, the abdomen united to the body by its whole breadth, and terminated on the under side by a pair of organs (ovipositors) which are employed in the act of depositing the eggs in the bark of trees, the twigs of various plants, or within the epidermis of the leaves, something in the same manner as the common hand-saw of mechanics. Thirty British species have been described, some of which, in their larva state, do great mischief to plants.

SAW'-GIN, *n.* A machine used to divest cotton of its husk and other superfluous parts.

SAW'-MILL, *n.* A mill for sawing timber, and driven by water or steam. There are two distinct kinds of saw-mills, the *circular* and the *reciprocating*. In the first kind the cutting instrument is a circular plate revolving upon its axis, and having teeth upon its circumference, so that it cuts by a continuous rotatory motion. In the reciprocating saw-mills the cutting instrument operates in the same manner as the common pit or frame-saw, but several saws may be connected together and moved by the same machinery. The circular saw-mills are for the most part used for cutting up timber of small dimensions, or for cutting veneers or very thin boards. Reciprocating saw-mills are used for large timber, in forming beams, rafters, planks, &c., out of large timber.

SAW'-PIT, *n.* A pit over which timber is sawed by two men, one standing below the timber and the other above.

Common saw-wort, *S. tinctoria*, is a perennial plant indigenous to England, growing in woods and in pasture grounds. It is used for dyeing cloth yellow, and is considered useful against piles.

SAWYER, *n.* One whose occupation is to saw timber into planks or boards, or to saw wood for fuel.—2. In *America*, a tree which, being undermined by a current of water, and falling into the stream, lies with its branches above water, which are continually raised and depressed by the force of the current, from which circumstance the name is derived. The *sawyers* in the Mississippi render the navigation dangerous, and frequently sink boats which run against them.

SAXIFRAGA'CEÆ, *n.* A nat. order of plants, belonging to the apocarpous group of polypetalous exogens. It consists of shrubs and herbaceous plants, with single alternate leaves, without stipules. The flowers are usually white, delicate, and beautiful. The species inhabit the mountainous districts of Europe and the northern parts of the world. According to De Candolle the whole order is more or less astringent. The root of *Heuchera Americana* is a powerful astringent, and called in North America *alum root*.

SAXIFRAGE, *n.* [*L. saxifraga*; composed of *saxum*, a stone, and *frango*, to break.] A medicine that has the property of breaking or dissolving the stone in the bladder. But in *bot.*, the anglicization of Saxifraga, a genus of plants, of the class Decandria, and order digynia, Linn.; nat. order Saxifragacæ. The species are mostly inhabitants of alpine and subalpine regions, of the colder and temperate parts of the northern zone. Most of them are true rock plants, and many are well known as ornamental plants in our gardens, as *S. umbrosa*, London pride, or none-so-pretty; *S. granulata*, white or granulated meadow saxifrage; *S. cotyledon*, or pyramidal saxifrage; *S. hypnoides*, mossy saxifrage or ladies' cushion; *S. crassifolia*, or thick-leaved saxifrage; *S. sarmentosa*, or Chinese saxifrage. Twenty-five species of saxifrage have been enumerated by British botanists. These plants were formerly supposed to be good against the stone in the bladder; hence the name. The *burnet saxifrage* is of the genus *Pimpinella*; the *golden saxifrage* is of the genus *Chrysosplenium*; the *meadow saxifrage* is of the genus *Peucedanum*.

SÄY, *v. t. pret.* and *pp. said*, contracted from *sayed*. [*Sax. sagan, saygan*; *G. sagan*; *Ch. sara, suchu*, to speak or say.

The same verb in Arabic, *sauga*, signifies to *sinh*, Goth. *siycan*. The sense of the root is to throw or thrust.] 1. To speak; to utter in words; as, he *said* nothing; he *said* many things; he *says* not a word. *Say* a good word for me. It is observable that although this word is radically synonymous with *speach* and *tell*, yet the uses or applications of these words are different. Thus, we say, to *speach* an oration, to *tell* a story; but in these phrases, *say* can not be used. Yet to *say* a lesson is good English, though not very elegant. We never use the phrases, to *say* a sermon or discourse, to *say* an argument, to *say* a speech, to *say* testimony. A very general use of *say* is to introduce a relation, narration, or recital, either of the speaker himself or of something said or done, or to be done by another. Thus, Adam *said*, This is bone of my bone; Noah *said*, Blessed be the Lord God of Shem. If we *say* we have no sin, we deceive ourselves. *Say* to the cities of Judah, Behold your God. I can not *say* what I should do in a similar case. *Say* thus precedes a sentence. But it is perhaps impracticable to reduce the peculiar and appropriate uses of *say*, *speach*, and *tell* to general rules. They can be learnt only by observation.—2. To declare; Gen. xxxvii.—3. To utter; to pronounce.

Say now Shilboleth; Judg. xii.

4. To utter, as a command.

—9. To testify; Acts xxiv.—10. To argue; to allege by way of argument.

After all that can be *said* against a thing. *Tillotson*.

11. To repeat; to rehearse; to recite; as, to *say* a lesson.—12. To pronounce; to recite without singing. Then shall be *said* or sung as follows.—13. To report; as, in the phrases, it is *said*, they *say*.—14. To answer; to utter by way of reply; to tell.

Say, Stella, feel you no content, Reflecting on a life well spent? *Swift*.

Note.—This verb is not properly intransitive. In the phrase, "as when we *say*, Plato is no fool," the last clause is the object after the verb; that is, "we *say* what follows." If this verb is properly intransitive in any case, it is in the phrase, "that is to *say*," but in such cases, the subsequent clause is the object of the verb, being that which is said, uttered, or related.

To burn or painfully affect and injure by immersion in or contact with a liquor of a boiling heat, or a heat approaching it; as, to *scald* the hand or foot. We *scald* the part when the heat of the liquor applied is so violent as to injure the skin and flesh. *Scald* is sometimes used to express the effect of the heat of other substances than liquids.

The small shell or crust which composes a part of the covering of a fish; and hence, any thin layer or leaf exfoliated or separated; a thin lamina; as, *scales* of iron or of bone. The *scales* of fish consist of alternate layers of membrane and phosphate of lime. The *scales* of serpents are composed of a horny membrane, without the calcareous phosphate. The *scales* of plants are thin, flat, membranous, scurf-like processes, formed of cellular tissue.—4. A ladder; series of steps; means of ascending. [L. *scala*.]—5. The act of storming a place by mounting the

walls on ladders; an escalade, or scalade.—6. In *math.*, a *scale* is any line drawn upon wood, ivory, or other solid substance, and divided into parts equal or unequal, the lengths of which may be taken off by the compasses, and transferred to paper, in aid of any geometrical construction. The manner in which the scale is divided depends of course upon the nature of the algebraical or trigonometrical expression, the values of which are to be represented. The most simple of all scales is that in which the divisions are equal, or, as it is called, a scale of equal parts. The term *scale*, however, is generally applied to a thin flat rule of wood, ivory, or metal, and of a rectangular form, having an assemblage of lines and figures engraved on it, for the purpose of measuring distances, extent, proportions, &c.; the lines being variously divided according to the purpose which the instrument is intended to serve.—*Plain scale*, a flat rule, one or two feet in length, and about two inches broad. It has, drawn upon it lines of equal parts; lines of chords, sines, tangents, secants, &c.—*Gunter's scale*, a large plain scale usually two feet long and an inch and a half broad. On one side of it are placed the natural lines; as the line of chords, the line of sines, tangents, rhombs, &c.; and on the other the corresponding logarithmic lines. By means of these lines the various problems in trigonometry may be solved, with the aid of a pair of compasses. Gunter's scale is used specially for solving questions in navigation.—*Diagonal scale*. [See under DIAGONAL.] The word *scale* is used in mensuration to signify a line or rule of a definite length divided into a given number of equal parts, and used for the purpose of measuring other linear magnitudes. It becomes a *standard scale*, when all its divisions have been examined and compared with some standard measure. The scales of thermometers are graduated from some arbitrary point, or *zero* (as that which indicates the temperature of freezing water), from which the temperature is counted upwards or downwards in degrees, which are also arbitrary. Scales of equal parts, marked upon plans, drawings, are lines explanatory of the real dimensions of the objects delineated, instead of their actual dimensions on the paper.—7. Regular gradation; a series rising by steps or degrees like those of a ladder. Thus, we speak of the *scale* of being, in which man occupies a higher rank than brutes, and angels a higher rank than man.—8. Any instrument, figure, or scheme graduated for the purpose of measuring extent or proportions; as a map drawn by a *scale* of half an inch to a league.—9. In *music*, a gamut; a diagram; or a series of lines and spaces rising one above another, on which notes are placed; or a scale consists of the regular gradations of sounds. A *scale* may be limited to an octave, called by the Greeks a tetrachord, or it may extend to the compass of any voice or instrument. [See DIATONIC, CHROMATIC.]—10. Any thing graduated or marked with degrees at equal distances.—*Scale of equivalents*, in *chem.*, an instrument devised by Wollaston, consisting of a flat scale with a slide, having engraved on it a table of equivalents, comprehending all those substances

which are most frequently employed by chemists in the laboratory. From the mathematical construction of the scale, it not only serves the same purpose as other tables of equivalents, but in many instances it supersedes the necessity of calculation. Thus, if it is required to determine how many parts of sulphuric acid, and how many of potassa are contained in 100 parts of sulphate of potassa, it is only necessary to move the slide until 100 marked upon it is in a line with the name sulphate of potassa, on the fixed part of the scale, and the numbers on the slide opposite to the terms sulphuric acid and potassa, will give the precise quantity of each contained in 100 parts of the compound. In the original scale of Wollaston, oxygen is taken as the standard of comparison; but hydrogen may be selected with equal propriety, and scales of this kind have been prepared by Reid of Edinburgh. [See EQUIVALENT.]—11. In *arith.*, the order of progression on which any system of notation is founded; as, the *binary scale*, *denary scale*, &c.

SCIENCE, *n.* [*Fr. from L. scientia, from scio, to know. Scio is probably a contracted word.*] 1. In a *general sense*, knowledge, or certain knowledge; the knowledge of many methodically digested and arranged so as to become attainable by one; the comprehension or understanding of truth or facts by the mind. The *science* of God must be perfect.—2. In *philosophy*, a collection of the general principles or leading truths relating to any subject. *Pure science*, as the mathematics, is built on self-evident truths; but the term *science* is also applied to other subjects founded on generally acknowledged truths, as *metaphysics*; or on experiment and observation, as *chemistry* and *natural philosophy*; or even to an assemblage of the general principles of an art, as the *science of agriculture*; the *science of navigation*. The knowledge of reasons and their conclusions, constitutes *abstract science*; that of causes and effects, and of the laws of nature, *natural or physical science*. The term *science* is often used to signify that which we know inductively, or by the experience of particulars, from which we ascend to general conclusions not necessarily constituted by those particulars, yet warranted by previous experience and by analogies widely observed. This signification of the term is applicable to *physical, moral, and practical science*.—*Physical or natural science* is that which is susceptible of experiment, and is therefore said to be founded on experimental evidence.—*Moral science*, is that which, lying in great part beyond the reach of experiment, rests for its certainty on aggregated facts, supported by concurrent testimony, by experience, and by analogy, so as to leave no room for doubt, though not demonstrable.—*Practical science*, is that which consists of general observations arising out of experience, and is otherwise called *theory* in correlation to an art or practice belonging to it. The term *science*, however, is more particularly used in contradistinction to *art and literature*. As distinguished from the former, a *science* is a body of truths, the common principles of which are supposed to be known and separated, so that the individual truths, even though some or all may be clear in themselves, have a guarantee that they could have been discovered and known either with certainty, or with such probability as the subject admits of, by other means than their own evidence. [*See ART.*] As distinguished from *literature*, *science* is applied to any branch of knowledge which is made the subject of investigation with a view to discover and apply first principles. [*See LITERATURE.*] A principle in *science* is a rule in art. *Playfair.*

3. Art derived from precepts or built on principles.

Science perfects genius. *Dryden.*

4. Any art or species of knowledge.

No *science* doth make known the first principles on which it buildeth. *Hooker.*

5. One of the seven liberal branches of knowledge, viz., grammar, logic, rhetoric, arithmetic, geometry, astronomy, and music.

Note.—Authors have not always been careful to use the terms *art* and *science* with due discrimination and precision. Music is an *art* as well as a *science*. In general, an *art* is that which depends on practice or performance, and *science* that which depends on abstract or speculative principles. The theory of music is a *science*; the practice of it an *art*.

This word is only a different orthography of *screech* and *shriek*, but is not elegant.] To utter suddenly a sharp shrill sound or outcry; to *screeam*; as in a sudden fright; also, to *creak*, as a door or wheel. [*See SCRÈECH*.]

[When applied to things, we use *creak*, and when to persons, *shriek*, both of which are in good use.]

SCRÈAK, *n.* A creaking; a screech.

SCRÈAM, *v. i.* [*Sax. reomian, hræman* or *hreman*; *W. ysgrarnu*, to set up a scream or shout. It appears from the Welsh that this is also the English *shirmish*, *Sp. escaramuzar*, which in *D.* is *schermutselen*, from *scherm*, a fence or screen; *schermen*, to fence. The primary sense is to thrust, drive, or force out or away, to separate.] 1. To cry out with a shrill voice; to utter a sudden, sharp outcry, as in a fright or in extreme pain; to *shriek*.

The fearful matrons raise a *screeaming* cry. *Dryden*.

SCREAMER, n. One that screams.—2. A name given to two species of South American birds, of the genus *Palamedea*, Linn., usually ranked with the grallatorial or wading birds; so called from their loud shrill cry. [See *PALAMEDEA*.]

SCREED, n. In *plastering*, ledges of lime and hair about 6 or 8 inches wide, by which any surface about to be plastered is divided into bays or compartments. The screeds are 4, 5, or 6 feet apart, according to circumstances, and are accurately formed in the same plane by the plumb rule and straight edge. They thus form gauges for the rest of the work, and when they are ready, the panels or compartments between them are filled in flush with plaster, and a long float being made to traverse them, all the plaster which projects beyond them is struck off, and the whole surface reduced to the same plane.

SCREEN, n. [Fr. *ecran*. This word is evidently from the root of *L. cerno*, *ex-cerno*, Gr. *σινω*, to separate, to sift, to judge, to fight, contend, skirmish; Sp. *harnero*, a sieve. The primary sense of the root is to separate, to drive or force asunder, hence to sift, to discern, to judge, to separate, or cut off danger.] 1. Any thing that separates or cuts off inconvenience, injury, or danger; and hence, that which shelters or protects from danger, which hides, conceals, or prevents inconvenience. In particular, a *screen* is a kind of partition, often movable, and used for concealment, for excluding cold, or light, or intercepting the heat of a fire.

Some ambitious men seem as *screens* to princes in matters of danger and envy.

Bacon.

2. A riddle or sieve, used by farmers for sifting earth or seeds. Among *builders*, a kind of wire sieve for sifting sand, lime, gravel, &c. It consists of a rectangular wooden frame with metal wires traversing it longitudinally at regular intervals. It is propped up in nearly a vertical position, and the materials to be sifted or screened are thrown against it, when the finer par-

ticles pass through and the coarser remain. A similar apparatus is used for

Builder's Screen.

separating lump coal from the small coal and dross.—3. In *arch.*, the partition that divides one part of a church from the other, as the *altar-screen*, the *organ-screen*, *monumental-screen*, &c. SCREEN, v. t. To separate or cut off from inconvenience, injury, or danger; to shelter; to protect; to protect by hiding; to conceal; as, fruits *screened* from cold winds by a forest or hill. SCREW, n. [D. *schroef*; G. *schraube*. The primary sense is probably to turn, or rather to strain.] 1. A cylinder of wood or metal, consisting of a helical ridge or groove winding round a cylinder, so as to cut every line on the surface parallel to the axis, at the same angle. The screw forms one of the six mechanical powers, and is simply a modification of the inclined plane, as may be shewn by cutting a piece of paper in the form of a right angled triangle, so as to represent an inclined plane, and applying it to a cylinder with the perpendicular side of the triangle, or altitude of the plane, parallel to the axis of the cylinder. If the triangle be then rolled about the cylinder, the hypotenuse which represents the length of the plane will trace upon the surface of the cylinder a helical line, which, if we suppose it to have thickness, and to protrude from the surface of the cylinder, will form the thread of the screw. The energy of the power applied to the screw thus formed, is transmitted by means of a hollow cylinder of equal diameter with the solid or convex one, and having a helical channel cut on its inner surface so as to correspond exactly to the thread raised upon the solid cylinder. Hence the one will

work within the other, and by turning the convex cylinder, while the other remains fixed, the former will pass through the latter, and will advance every revolution through a space equal to the distance between two contiguous threads. The convex screw is called the *male*, and the concave or hollow screw the *female screw*, or they are more frequently termed simply the screw and nut respectively. As the screw is a modification of the inclined plane, it is not difficult to estimate the mechanical advantage obtained by it. If we suppose the power to be applied to the circumference of the screw, and to act in a direction at right angles to the radius of the cylinder, and parallel to the base of the inclined plane by which the screw is supposed to be formed; then the power will be to the resistance as the distance between two contiguous threads, to the circumference of the cylinder. But as in practice, the screw is combined with the lever, and the power applied to the extremity of the lever, the law becomes: The power is to the resistance, as the distance between two contiguous threads, to the circumference described by the power. Hence the mechanical effect of the screw is increased by lessening the distance between the threads, or making them finer, or by lengthening the lever to which the power is applied. The law, however, is greatly modified by the friction, which is very great.—*Hunter's double screw*, a contrivance for increasing the power of the screw. It consists of a combination of two screws of unequal fineness, one of which works within the other, the external one being also made to play in a nut. In this case the power does not depend upon the interval between the threads of either screw, but on the difference between the intervals in the two screws. Thus, if the external screw have 20 threads in an inch, and the internal 21, then in one revolution the external screw will descend through $\frac{1}{20}$ of an inch, and the internal will move in an opposite direction through $\frac{1}{21}$ of an inch, so that on the whole the internal screw will be depressed $\frac{1}{20}$ of an inch, and raised through $\frac{1}{21}$ of an inch by the external screw, and its actual depression will consequently be the excess of $\frac{1}{20}$ of an inch above $\frac{1}{21}$ of an inch, that is, $\frac{1}{420}$ of an inch. Hence it is easy to see that the power of this screw may be increased to almost any extent.—*Endless screw*, a screw combined with a wheel and axle in such a manner that the threads of the screw work into the teeth fixed on the periphery of the wheel. Such a combination may be employed for raising weights, or producing rotatory motion.—*Screw of Archimedes*. [See *ARCHIMEDES' SCREW*.]—*Micrometer screw*, a fine screw adapted to astronomical and optical instruments, for the purpose of measuring angles with great exactness; it is also used for subdividing a space into very minute equal parts, or for measuring minute spaces or distances.—*Screw-propeller*, an ingenious contrivance which has been recently applied with considerable success to supersede the use of paddles in the propulsion of vessels moved by steam power. A shaft furnished with broad helical arms is fitted to revolve in bearings in the dead-wood at the stern of the vessel, and is set in rapid motion

by the steam engines. This rotatory motion in the surrounding fluid, which may be considered to be in a partially inert condition, produces, according to the well known principle of the screw an onward motion of the vessel more or less rapid, according to the velocity of the shaft, the obliquity of the arms, and the weight of the vessel. The annexed figure shows the ordinary form and position of the screw-propeller.

Stern of Steam Vessel with Screw Propeller.

As a mechanical power, the screw has innumerable applications; but it is employed with most effect in all cases in which a very great pressure is required to be exerted within a small space, and without intermission. Hence it is the power generally used for expressing juices from solid substances, for compressing cotton and other goods into hard dense masses for the convenience of carriage, for coining, stamping, printing, &c. Machines of this kind are called *screw presses*.—*Screw nails* and *wood screws*, a kind of screws very much used by carpenters and other mechanics for fastening two or more pieces of any material together. When they are small they are turned by means of an instrument called a *screw driver*.—*Screw wrench* or *key*, a mechanical instrument employed to turn large screws or their nuts.

blishments for forming the screws of bolts and nuts by means of the machinery of the factory. For this purpose tools are employed termed *taps* and *dies*, being simply counterparts in hard tempered steel of the screws to be produced, and formed with appropriate cutting edges. The motion of the machine forces the tap to penetrate the nut, and so form the screw in it, while the bolt is screwed by simply inverting this process, using the dies instead of the tap.

SCROFULA, *n.* [*L.* In *G. kropf* is *crop*, *craw*, and *scrofula*. In *D.* it is *kropzeer*, neck-sore.] A disease, consisting in hard indolent tumours of the conglobate glands in various parts of the body, but particularly in the neck, behind the ears and under the chin, which after a time suppurate and degenerate into ulcers, from which, instead of pus, a white curdled matter is discharged. Scrofula is not contagious, but it is often a hereditary disease; its first appearance is most usually between the third and seventh year of the child's age, but it may arise between this and the age of puberty; after which it seldom makes its first attack. It is promoted by every thing that debilitates, but it may remain dormant through life and not shew itself till the next generation. In mild cases the glands, after having suppurated, slowly heal; in others, the eyes and eyelids become inflamed, the joints become affected, the disease gradually extending to the ligaments and bones, and producing a hectic and debilitated state under which the patient sinks; or it ends in tuberculated lungs and pulmonary

consumption. It is more properly called *struma*. The popular name *king's-evil* is applied to this disease only when it is seated in glands.

It is much more prevalent in cold climates than in warm, and chiefly affects sailors during long voyages, and such as are shut up in besieged places, being occasioned by confinement, in-nutritious food, and hard labour in conjunction; but more especially by confinement for a long period of time, to a limited range of food, which is incapable of supplying the elements necessary to repair the waste of the system. Fresh vegetables, farinaceous substances, and brisk fermented liquors, good air, attention to cleanliness, and due exercise, are among the principal remedies. This disease has been called *purpura* by some nosologists, but by Good it is more appropriately styled *porphyra*.

It consists of a long curving blade with a sharp edge, made fast to a handle, and which is bent into a convenient form for swinging the blade to advantage. The blade is fixed to the handle, at an angle both to the plane of the blade and to the tangent to the curve of the blade. It is on the adjustment of these angles that the perfection of the instrument depends. Most scythes have two projecting handles fixed to the principal handle, by which they are held. The real line of the handle is that which passes through both the hands, and ends at the head of the blade. This may be a straight line or a crooked one, generally the latter, and by moving these handles up or down the main handle, each mower can place them so as best suits the natural size

The person has a hook in one hand with which he collects a small bundle of the straggling corn, and with the scythe in the other hand

cuts it. Another species of scythe, much used in Aberdeenshire, has a short branching handle somewhat in the shape of the letter Y, having two small handles fixed at the extremities of the two branches at right angles to the plane in which they lie. Sea Serpent (*Hydrus Stokesii*).

the Australian seas, and is as thick as a man's thigh.—2. An enormous marine animal resembling a serpent, said to have been repeatedly seen on the coasts of America. Some assert it to be 100 feet long, and others as many yards. All accounts, however, agree as to the protuberances on its back, its vertical sinuosities, and its serpent-shaped head. The following is a very likely account of the origin of this fabulous monster:—

"In the Sooloo seas, I have often witnessed the phenomenon which first gave origin to the marvellous stories of the great sea-serpent, namely, lines of rolling porpoises, resembling a long string of buoys, oftentimes extending seventy, eighty, or a hundred yards. These constitute the so-named protuberances of the monster's

back, keep in close single file, progressing rapidly along the calm surface of the water, by a succession of leaps, or demi-vaults forwards, part only of their uncouth forms appearing to the eye. At the same moment, I have seen beautifully banded water-snakes, of the thickness of a man's leg, lying extended supinely along the glassy surface, or diving and swimming gracefully, with slow undulating lateral movements of their vertically compressed bodies."

The principal cause is no doubt the motion of the vessel, but it is often aggravated by the smells and effluvia of the vessel. The most effective antidote or remedy, consists in lying in a horizontal position. A common remedy among sailors, is a draught or two of sea water. The violence of the attacks not only varies in different individuals at different times, but the same person who escapes in one voyage shall suffer severely in another.

If the ship be deficient in any of these particulars, the owners, though ignorant of the circumstance, will be liable for whatever damage may in consequence be done to the goods of the merchant; and if an insurance has been effected upon her, it will be void. SEAL, *n.* [Sax. *seol*, *sele*, *syle*; Sw. *säl*.] The English name for a genus of marine carnivorous mammiferous quadrupeds, the *Phoca* of Linn., and now raised to the rank of a family under the name of *Phocidæ*. These animals are amphibious, most of them inhabiting the sea coasts, particularly in the higher latitudes. They have six or four incisors above, four or two below. Their hind feet are placed at

the extremity of the body, in the same direction with it, and serve the purpose of a caudal fin; the fore feet are also adapted for swimming, and furnished each with five claws; the external ears are either very small or wanting. The head of a seal bears a resemblance to that of a dog, whose intelligence and soft expressive look it also possesses. It is easily tamed, and soon becomes attached to its keeper or those who feed it. The seal not only furnishes food for the Esquimaux table, oil for his lamp, and clothing for his person; but even the bones and skin supply materials for his boats and his summer tents. There are numerous species; as the *leonina*, sometimes 18 feet in length, and the *jubata*, sometimes 25 feet in length, with a mane like a lion, both called *sea-lion*, and found in the

Marbled Seal (*Phoca discolor*.)

southern seas, and also in the N. Pacific; the *ursina*, or sea-bear, 8 or 9 feet in length, and covered with long thick and bristly hair, found in the N. Pacific; and the common seal [*P. vitulina*], from four to six feet in length, found generally throughout the Atlantic and the seas and bays communicating with it, covered with short, stiff, glossy hair, with a smooth head without external ears, and with the fore legs deeply immersed in the skin. As it frequents the British shores, the seal is well known and has been repeatedly described. Seals are principally hunted for their oil and skins. The skin, when tanned, is extensively employed in the making of shoes, and, when dressed with the hair on, serves for the covering of trunks, &c. In the arrangement of Cuvier, the morses, which form the genus *Trichecus* of Linn., are included among the Phocidae.

SEAL, *n.* [Sax. *sigel*, *sigle*; G. *siegel*; Fr. *secau*; L. *sigillum*.] It is uncertain what was the original signification of *seal*, whether an image or some ornament. In Saxon, the word signifies a necklace, or ornament for the neck, a stud or boss, a clasp, and a seal. 1. A piece of metal or other hard substance, usually round or oval, on which is engraved some image or device, and sometimes a legend or inscription for impressing the wax that makes fast a letter or other enclosed paper. It is also used by individuals, corporate bodies, and states, for making impressions on wax upon instruments of writing, as an evidence of their authenticity. *Seals* are sometimes worn in rings.—*Great seal*, a seal used for the united kingdoms of England and Scotland, and sometimes Ireland, in sealing the writs to summon parliament, treaties with foreign states, and all other papers of great moment.—*Privy seal*, a seal which the

sovereign of England uses previously in grants, &c., which are to pass the great seal, or in matters of subordinate consequence which do not require the great seal. *Lord privy seal*, the officer of state who keeps the privy seal. In Scotland, royal grants are the only deeds which are authenticated by means of seals. In addition to the great seal and privy seal, there is the quarter seal, so called from its having been originally the quarter, and merely the testimonial of the great seal.—*Seal of cause*. In Scotland, most royal burghs, and many superiors of burgh of barony, have conferred upon them, in their charters, the power of constituting subordinate corporations or crafts. The grant or charter by which such a constitution is given, and which defines the privileges and powers to be possessed by the subordinate corporation, is called the *seal of cause*.—2. The wax set to an instrument, and impressed or stamped with a seal. Thus we give a deed under hand and seal. Wax is generally used in sealing instruments, but other substances may be used.—3. The best red sealing wax is made by melting, in a very gentle heat, 43 parts of shell-lac with 19 of Venice turpentine, and 1 of Pernian balsam; 32 parts of the finest cinnabar, thoroughly levigated, are then stirred in, and the whole well mixed. When the mixture has cooled down, it is either rolled into sticks or shaped in brass moulds.

We distinguish the season by prefixing its appropriate name, as the spring-season, summer-season, &c. The *seceders* or Associate Synod, as they called themselves, remained a united body till 1747, when they split into two on a quarrel about a clause in the oath required to be taken by the burghes or freemen of some of the Scottish burghs, declaratory of their profession and hearty allowance of the "true religion at present professed within the realm, and authorized by the laws thereof;" the larger division, who held that the oath might be conscientiously taken by *seceders*, calling themselves burghers, and their opponents taking the name of *antiburghers*. But in 1820, the burghers and *antiburghers* coalesced again into the United Associate Synod. It is not with public as with private prayer; in this, rather *secrecy* is commanded than outward show. Hooker.

4. Fidelity to a secret; close silence; the act or habit of keeping secrets. For *secrecy* no lady closer. Shak.

SE'CRET, *a.* [Fr. *secret*; L. *secretus*.] This is given as the participle of *secreo*, but it is radically a different word; *W. segyr*, that is apart, inclosed or *sacred*; *segru*, to secrete or put apart; *sêg*, that is without access. The radical sense of *sêg* is to separate, as in L. *seco*, to cut off; and not improbably this word is contracted into the Latin *se*, a prefix in *segrego*, *separo*, &c.] 1. Properly, separate; hence, hid; concealed from the notice or knowledge of all persons except the individual or individuals concerned.

I have a *secret* errand to thee, O king;

SE'CRETARISHIP, *n.* The office of a secretary.

SE'CRETARY, *n.* [Fr. *secrétaire*; from L. *secretus*, secret; originally a confidant, one intrusted with secrets.]

1. A person employed by a public body, by a company or by an individual, to write orders, letters, despatches, public or private papers, records and the like. Thus legislative bodies have *secretaries*, whose business is to record all their laws and resolves. Ambassadors have *secretaries*.—2. An officer whose business is to superintend and manage the affairs of a particular department of government; as, the *secretary* of state, who conducts the correspondence of a state with foreign courts; the *secretary* of the treasury, who manages the department of finance; the *secretary* at war, of the navy, &c. In the British government there are three principal secretaries of state; viz., one for foreign affairs, one for the home department, and one for the colonies, each of whom has two under secretaries. The principal secretaries are always *ex officio* cabinet ministers. The secretary at war is attached to the War Office. The secretary of state, for Ireland, is keeper of the privy seal of that part of the kingdom, and chief secretary to the lord lieutenant.

SE'CRETARY BIRD, *n.* An African

Secretary (Cypocyanus serpentarius).

bird of prey, of the genus *Cypocyanus*

the *G. serpentarius*, called also the snake-eater. It is about three feet in length; the legs are long, so as to resemble those of a heron; the beak is hooked, and the eyelids projecting. It has an occipital crest of feathers, which can be raised or depressed at pleasure. It inhabits the dry and open grounds in the vicinity of the Cape, where it hunts reptiles on foot. Cuvier places it among his Diurnæ or diurnal birds of prey.

SE'CRÈTE, *v. t.* To hide; to conceal; to remove from observation or the knowledge of others; as, to *secrete* stolen goods.—2. To secrete one's self; to retire from notice into a private place; to abscond.—3. In the animal economy, to secrete; to produce from the blood substances different from the blood itself, or from any of its constituents; as the glands. The liver *secretes* bile; the salivary glands *secrete* saliva. 4. In *vegetable physiology*, to separate substances from the sap.

SE'CRETED, *pp.* Concealed; secernd.

SE'CRETING, *ppr.* Hiding; secernd.

SE'CRETION, *n.* The act of secernd; the act or process by which substances are separated from the blood, differing from the blood itself, or from any of its constituents, as bile, saliva, mucus, urine, &c. This was considered by the older physiologists as merely a separation from the blood of certain substances previously contained in it, the literal meaning of *secretion*; but this opinion is now generally exploded. The organs of secretion are of very various form and structure, but the most general are those called *glands*.

The animal secretions are arranged by Bostock under the heads aqueous, albuminous, mucous, gelatinous, fibrinous, oleaginous, resinous and saline. Magendie arranges them into three sorts, 1. *Exhalations*, which are either external, as those from the skin and mucous membranes; and internal; as those from the surfaces of the closed cavities of the body, and the lungs.—2. *Follicular secretions*, which are divided into mucous and cutaneous; and 3. *Glandular secretions*, such as milk, bile, urine, saliva, tears, &c. Every organ and part of the body secretes for itself the nutriment which it requires.—2. The matter secreted, as mucus, perspirable matter, &c.—3. The process by which substances are separated from the sap of vegetables, also the matter secreted. The descending sap of plants is not merely subservient to nutrition, but furnishes various matters which are secreted or separated from its mass, and afterwards elaborated by particular organs. These secretions are exceedingly numerous, and constitute the great bulk of the solid parts of plants.

They have been divided into, 1. *General or Nutritious secretions*, the component parts of which are gum, sugar, starch, lignine, albumen, and gluten; and 2. *Special or local secretions*, which may be arranged under the heads of acids, alkalies, neuter principles, resinous principles, colouring matters, milks, oils, resins, &c.

SE'CRETIST, † *n.* A dealer in secrets.

SE'CRETITIOUS, *a.* Parted by animal secretion.

SE'CRETIVENESS, *n.* In *phrenology*, that organ which, when largely developed, is said to impel the individual towards secrecy or concealment. It is situated at the inferior edge of the

parietal bones, immediately above De-striuctiveness.

SE'CRETLY, *adv.* Privately; privily; not openly; without the knowledge of others; as, to despatch a messenger *secretly*.—2. Inwardly; not apparently or visibly; latently.

Now *secretly* with inward grief she pin'd.
Addition.

1. A body or number of persons who follow some teacher or leader, or are united in some settled tenets, chiefly in philosophy or religion, but constituting a distinct party by holding sentiments different from those of other men. Any body which separates from the established religion of a country. Most *sects* have originated in a particular person, who taught and propagated some peculiar notions in philosophy or religion, and who is considered to have been its founder. Among the Jews, the principal *sects* were the Pharisees, Sadducees, and Essenes. In Greece were the Cynic *sect*, founded by Antisthenes; and the Academic *sect*, by Plato. The Academic *sect* gave birth to the Peripatetic, and the Cynic to the Stoic.—2. † A cutting or seion.

SECT'ION, *n.* [Fr. from L. *sectio*; *seco*, to cut off.—1. The act of cutting, or of separating by cutting; as, the *section* of bodies.—2. A part separated from the rest; a division.—3. In *books* and *writings*, a distinct part or portion; the subdivision of a chapter; the division of a law or other writing or instrument. In laws, a *section* is sometimes called a paragraph or article.—4. A distinct part of a city, town, country, or people; a part of territory separated by geographical lines, or of a people considered as distinct. Thus we say, the northern or eastern *section* of the

United States, the middle *section*, the southern or western *section*.—5. In *geom.*, the line formed by the intersection of two surfaces, and likewise the surface formed when a solid body is cut by a plane. When a plane is cut by a plane, the section is a straight line, called the *common section* of the two planes. When a sphere is cut by a plane, the section is a circle; and when a cone is cut by a plane, the section may be a triangle, a circle, an ellipse, a parabola, or an hyperbola, which five figures are called the *conic sections*. See *Conic sections*.—6. In *arch.*, the projection or geometrical representation of a building supposed to be cut by a vertical plane for the purpose of exhibiting the interior, and describing the height, breadth, thickness, and manner of construction of the walls, arches, domes, &c.—*Section of a Machine*, a drawing or representation of a machine, exhibiting it as it would appear if cut through by a plane.—7. SECT'IONAL, *a.* Pertaining to a section or distinct part of a larger body or territory.

SECT'IONALLY, *adv.* In a sectional manner.

SECT'OR, *n.* [Fr. *secteur*, from L. *seco*, to cut.] 1. In *geom.*, a part of a circle comprehended between two radii and the arc; or a mixed triangle, formed by two radii and the arc of a circle. Thus A C B, contained within the radii

C A, C B, and the arc A B, is a sector of which the arc A B is a portion.—

2. A mathematical instrument so marked with lines of sines, tangents, secants, chords, &c., as to fit all radii and scales, and useful in making diagrams, laying down plans, &c. Its principal advantage consists in the facility with which it gives a graphical determination of proportional quantities. It becomes incorrect, comparatively, when the opening is great, or the result greater than the data. The sector is founded on the fourth proposition of the sixth book of Euclid, where it is proved that equiangular triangles have their homologous sides proportional. It consists of two rulers, (generally of brass or ivory), representing the radii of a circular arc, and moveable round a joint, the middle of which forms the centre of the circle. From this centre, there are drawn on the faces of the rulers various scales, the choice of which, and the order of their arrangement, may be determined by a consideration of the uses for which the instrument is intended.—3. In *astr.*, an instrument constructed for the purpose of determining with great accuracy the zenith distances of stars, passing within a few degrees of the zenith, where the effect of refraction is small. See *ZENITH*.—*Dip sector*, an instrument used for measuring the dip of the horizon.

SECU'LAR, *a.* [Fr. *seculaire*; L. *secularis*, from *seculum*, the world or an age.] 1. The *secular* concerns of life respect making provision

for the support of life, the preservation of health, the temporal prosperity of men, of states, &c. *Secular* power is that which superintends and governs the temporal affairs of men, the civil or political power; and is contradistinguished from *spiritual* or *ecclesiastical* power.—2. SEDI'TION, *n.* [*Fr.* from *L. seditio*; *L. sed-eo*; from *se*, a part, and *eo*, to go. The inseparable preposition *se* becomes *sed* before a vowel, in the same manner as *re* is changed into *red* before a vowel. *Sed-eo* must not be confounded with *sedeo*, to sit, the latter being derived from *Gr. ἵκουαι*, to sit. *Seditio*, then, may signify, literally, a separation, or departure from union or peace, from submission, or from obedience; hence, discord, dissension, insurrection amongst citizens.] A factious commotion of the people, or a tumultuous assembly of men rising in opposition to law, and in contravention of the public peace; Ezra iv.; Luke xxiii.; Acts xxiv.—2. In *law*, a general word, comprising, in common language, offences against the state which do not amount to high treason, but which tend to bring about or encourage the greater offence; such as the writing, publishing, or uttering of any words, tending to excite subjects to insurrection, though not urging them on to open rebellion, or total subversion of the government. The term *sedition*, however, is very difficult to define, and its meaning varies according to the state of political feeling at any given time. The act 36 Geo. III., provided against all seditious practices and attempts tending to high treason, and by the act 11 Victoria, the main provisions of the former were extended to Ireland, along with new enactments, which were made applicable to all parts of the United Kingdom. Ac-

cording to this latter act, now in force, any person or persons who shall, within the realm or without, compass, imagine, invent, devise, or intend to deprive or depose the Queen, her heirs and successors, from the style, honour, or royal name of the Imperial crown of this realm, or of any other of her Majesty's dominions and countries, or to levy war against her Majesty, her heirs and successors, within any part of the United Kingdom, in order by force or constraint to compel her or them to change her or their measures or counsels, or in order to put any force or constraint upon, or to intimidate or overawe both houses, or either house of parliament, or to move or stir any foreigner or stranger with force to invade the United Kingdom, or any other her Majesty's dominions, and such compassings, imaginations, inventions, devices, or intentions, or any of them, shall express, utter, or declare, by publishing any printing or writing, or by open and advised speaking, or by any overt act or deed, shall be deemed guilty of felony, and on being convicted, shall be liable, at the discretion of the court, to be transported beyond the seas for life, or for any term not less than seven years. Indictments for felony under this act are to be held valid, though the facts may amount to treason. In Scotland, the laws against sedition are more stringent than in England, being founded on old statutes against *leasing-making*, an offence still more difficult to define than sedition, though partaking generally of the same nature. Felonies under the present act in Scotland are not bailable, unless with consent of the public prosecutor, and the trial is to take place as prescribed by the act 1701.

SEE, v. t. pret. saw; pp. seen. [Sax. *seon*, *seogan*, *geseon*; G. *sehen*. This verb is contracted, as we know by the Eng. *sight*, Dan. *sigt*, G. *gesicht*. Ch. סָהָה, *saha*, סָהָה, *sehah*, or סָהָה, *sehi*, to see. In G. *besuchen* is to visit, to *see*, and this is from *suchen*, which is the Eng. to *seek*, and to *seek* is to look for. In G. *gesuch* is a *suit*, a seeking, demand, petition; and *tersuchen* is to try, Eng. *essay*. We have then decisive evidence that *see*, *seek*, L. *sequor*, and Eng. *essay*, are all from the same radix. The primary sense of the root is to strain, stretch, extend; and as applied to *see*, the sense is to extend to, to reach, to strike with the eye or sight.] 1. SEED, n. [Sax. *sæd*; G. *saat*; from the verb *sow*. Qu. W. *hād*, Arm. *had*.]

1. The substance, animal or vegetable, which nature prepares for the reproduction and conservation of the species. In plants the seed is the impregnated and matured ovule, which may be defined a body within the pericarp, and containing an organized embryo, which on being placed in favourable circumstances is developed, and converted into an individual similar to that from which it derived its origin. The reproductive organs of flowerless plants, such as sea-weeds and mushrooms, differ in structure, and in their mode of germination, and are not considered as true seeds, but are named *sporules*. The seed is attached to the placenta by a small pedicel or *umbilical cord*, also named *podosperm*. In some plants this pedicel is usually expanded, and rising round the seed, forms a partial covering to it, named the *arillus*; as in the nutmeg, in which it constitutes the part called *mace*. The point of attachment of the cord or *podosperm* is named the *hilum*. The seed is composed of an external skin, the *testa* or *perisperm*, and a *kernel* or *nucleus*. In some cases, the seeds constitute the fruit or valuable part of plants, as in the case of wheat and other esculent grain; sometimes the seeds are enclosed in the fruit, as in apples and melons.

When applied to animal matter, it has no plural.—2. That from which any thing springs; first principle; original; as, the *seeds* of virtue or vice.—3. Principle of production.

4. Progeny; offspring; children; descendants; as, the *seed* of Abraham; the *seed* of David. In this sense, the

word is applied to one person, or to any number collectively, and admits of the plural form; but rarely used in the plural.—5. Race; generation; birth. Of mortal *seed* they were not held.

SEE'ING, ppr. [from *see*.] Perceiving by the eye; knowing; understanding; observing; beholding.

Note.—This participle, improperly classed by grammarians among conjunctions, appears to be used indefinitely, or without direct reference to a person or persons. "Wherefore come ye to me, *seeing* ye hate me?" Gen. xxvi. That is, since, or the fact being that or thus; because that. In this form of phraseology, *that* is understood or implied after *seeing*; why come ye to me, *seeing that*, ye hate me? The resolution of the phrase or sentence is, ye hate me; that fact being seen or known by you, why come ye to me? or, why come ye to me, ye *seeing* [knowing] that fact which follows, viz., ye hate me. In this case, *seeing* retains its participial character, although its relation to the pronoun is somewhat obscured. Originally, *seeing*, in this use, had direct relation to the speaker or to some other person. "Now I know that thou fearest God, *seeing* thou hast not withheld thy son;" Gen. xxii. Here *seeing* refers to I, or according to the language of syntax, agrees or accords with I. I know thou fearest God, for I see thou hast not withheld thine only son; I know thou fearest God by *seeing*, in consequence of *seeing* this fact, thou hast not withheld thine only son. But the use of *seeing* is extended to cases in which it can not be referred to a specific person or persons, in which cases it expresses the notoriety or admission of a fact in general, and is left, like the French *on*, in the phrases *on dit*, *on voit*, without application to any particular person.

SEE'ING, *n.* Sight; vision.

SEEK, *v. t. pret.* and *pp.* *sought*, pronounced *sawt*. [Sax. *secan*, *sæcan*, to seek, to come to; *asecan*, to require; *gesecan*, to seek, to come to; *forsæcan*, *forsæcan*, to forsake; G. *suchen*, to seek; *absuchen*, to pick off; *besuchen*, to visit, to see; *gesuch*, suit, petition; *gesuche*, a continued seeking; *versuchen*, to try, prove, *essay*, strive; *versuch*, trial, *essay*; D. *zoeken*, to seek, to look for, to try or endeavour; *bezoeken*, to visit, to try; *gezoek*, a seeking; *opzoeken*, to seek; *verzoeken*, to request, desire, invite, try, tempt, to visit; Dan. *søger*, to seek, to endeavour; *besøger*, to visit; *forsøger*, to try, to *essay*, to experiment, to tempt; *opsøger*, to seek or search after; S. *söha*, to seek, to sue, to court; *söha en lagligen*, to sue one at law; *besöha*, to visit; *försöha*, to try, to *essay*, to tempt. These words all accord with L. *sequor*, Ir. *seichim*, to follow; for to *seek* is to go after, and the primary sense is to advance, to press, to drive forward, as in the L. *peta*. See ESSAY, from the same root, through the Italian and French. Now in Sax. *forsæcan*, *forsæcan*, is to forsake; *sæcan* is to strive, contend, whence English *sake*, and *sæcan*, *secan*, is to seek. But in Swedish, *försäka*, to forsake, to renounce, is from *sah*, thing, cause, suit, Sax. *saca*, English *sake*; in Danish, *forsæger*, to renounce, is from *siger*, to say; *sag*, a thing, cause, matter, suit; *sagd*, a saying; G. *versagen*, to deny, to renounce, from *sagen*, to say, to tell; D. *verzaaken*, to deny, to forsake, to revoke, from *zaak*, thing, cause, and *zeggen* is to say or tell, which is the Sax. *secgan*, to say. These close affinities prove that *seek*, *essay*, *say*, and L. *sequor*, are all from one radix, coinciding with Ch. עָשָׂה, *asah*, to seek, to strive. The English verb *see* seems to be from the

same root.] I. To go in search or quest of; to look for; to search for by going from place to place.

2. To inquire for; to ask for; to solicit; to go; to find; to endeavour to find or gain by any means.

The young lions roar after their prey, and seek their meat from God; Ps. civ.

He found no place for repentance, though he sought it carefully with tears; Heb. xii. Others tempting him, sought of him a sign; Luke xi.

3. *Seek* is followed sometimes by *out* or *after*. To *seek out*, properly implies to look for a specific thing among a number. But in general, the use of *out* and *after* with *seek*, is unnecessary and inelegant.—To *seek God*, his name, or his face, in Scripture, to ask for his favour, direction and assistance; Ps. lxxiii.; lxxxiii.—*God seeks men*, when he fixes his love on them, and by his word and Spirit, and the righteousness of Christ, reclaims and recovers them from their miserable condition as sinners; Ezek. xxxiv; Ps. cxix; Luke xv.—*To seek after the life*, or *soul*, to attempt by arts or machinations; or to attempt to destroy or ruin; Ps. xxxv.—*To seek peace*, or *judgment*, to endeavour to promote it; or to practise it; Ps. xxxiv; Is. i.—*To seek an altar*, temple, or habitation, to frequent it; to resort to it often; 2 Chron. i; Amos v.—*To seek out God's works*, to endeavour to understand them; Ps. cxi.

SEEM, *v. i.* [G. *ziemen*, to become, to befit or suitable; *geziemen*, to become, to be seem, to be meet, decent, *seemly*. In D. *zweemen* is to be like, to resemble, and *taamen* is to fit or suit, to become. In Dan. *söm* is a *seam*, and *sömmen*, signifies to hem, and also to become, to be seem, to be suitable, decent, or *seemly*. This is certainly the G. *ziemen*; hence we see that *seam* and *seem* are radically the same word: It. *sembrare*, to seem; *sembiante*, like, similar, resembling; *rassembrare*, to resemble; Sp. *semejar*, to be like; Fr. *sembler*, to seem, to appear. These words seem to be of one family, having for their radical sense, to extend to, to meet, to unite, to come together, or to press together. If so, the Dutch *taamen* leads us to the oriental roots, Heb. Ch. and Syr. עָמַד, *damah*, to be like; Eth. *adam*, to please, to suit; Ar. *adama*, to add, to unite, to agree, to suit, to conciliate, to confirm concord. These verbs are radically one, and in these we find the primary sense of *Adam*; likeness, or form.] I. To appear; to make or have a show or semblance.

Thou art not what thou seem'st. Shak. All seem'd well pleas'd; all seem'd, but were not all. Milton.

2. To have the appearance of truth or fact; to be specious; to be understood as true. The phrase it *seems* (it appears), is often used to express slight affirmation, and also ironically to condemn the thing mentioned, like the old English *forsooth*; as this, it *seems*, is to be my task.

SELF, *a. or pron. plur. Selves;* used chiefly in composition. [*Sax. self, sylf; Dan. selv; G. selbst.* The primary sense of this word is probably to set or unite, or to separate from others. See SELVEDGE.] 1. In old authors, this word sometimes signifies particular, very, or same. "*And on thum sylfan gear;*" in that same year, that very year; *Sax. Chron. A.D. 1052, 1061.*

Shoot another arrow that self way.

On these self hills. *Shak. Ralegh.*
At that self moment enters Palamon.

Dryden.

In this sense, *self* is an adjective, and is now obsolete, except when followed by *same*; as, on the *self-same* day; the *self-same* hour; the *self-same* thing; which is tautology; *Math. viii.*—2. In present usage, *self* is united to certain personal pronouns and pronominal adjectives, to express emphasis or distinction; also when the pronoun is used reciprocally. Thus for emphasis, *I myself* will write; *I will examine for myself.* Thou *thyself* shalt go; thou shalt see for *thyself.* You *yourself* shall write; you shall see for *yourself.* He *himself* shall write; he shall examine for *himself.* She *herself* shall write; she shall examine for *herself.* The child *itself* shall be carried; it shall be present *itself.* Reciprocally, *I* *abhor myself;* thou *enrichest thyself;* *he* *loves himself;* she *admires herself;* it *pleases itself;* we *value ourselves;* ye *hurry yourselves;* they *see themselves.* *I* *did not hurt him, he hurt himself;* *he* *did not hurt me, I hurt myself.* Except when added to pronouns used reciprocally, *self* serves to give emphasis to the pronoun, or to render the distinction expressed by it more emphatical. "*I myself* will decide," not only expresses my determination to decide, but the determination that no other shall decide. *Himself, herself, themselves,* are used in the nominative case, as well as in the objective.

Jesus *himself* baptized not, but his disciples; *John iv.*: See *Math. xxiii. 4.*

3. *Self* is sometimes used as a noun, noting the individual subject to his own contemplation or action, or noting identity of person. Consciousness makes every one to be what he calls *self.*

4. It also signifies personal interest, or love of private interest; selfishness.

In such use, *senior* has no reference to age, for a *senior* counsellor may be, and often is the younger man. When father and son, in one family, or two persons of unequal age, in the same establishment, &c., bear the same name

the elder of the two is entitled *senior*; as, John Blackie, *senior*. [See JUNIOR.] SENIOR, *n.* (see 'nyor). A person who is older than another; one more advanced in life.—2. One that is older in office, or one whose first entrance upon an office was anterior to that of another. The senna of the shops consists, according to Delille, of *Cassia acutifolia*, *Cassia senna*, and *cyananchem argel*; which latter plant is employed in Egypt to adulterate the senna proper. Aleppo senna is yielded by *Cassia obovata*, and the senna of Mecca by *C. lanceolata*.

Senna (*Cassia lanceolata*).

In addition to the leaflets, the leaf-stalks and pods are frequently present, especially in the Alexandrian senna. The true senna leaves are distinctly ribbed, thin, generally pointed, and, when chewed, have a peculiar nauseous flavour, and yield a dark brown infusion. It is a gripping, nauseating, and somewhat drastic purge, and a most valuable addition to, or vehicle for, other purgatives.

SENSA'TION, *n.* [Fr.; It. *sensazione*; Sp. *sensacion*; from L. *sensus*, *sentio*, to perceive. See SENSE.] The perception of external objects by means of the senses, or the effect produced on the sensorium by something acting on the bodily organs. When an impression made on the extremity of a nerve is communicated to the sensorium so as to excite the consciousness of the mind, it is called a *sensation*. When the impression is produced by the action of a foreign body on an external part, it is called an *external sensation*; when it proceeds from some change taking place within the living system, and arising from its own actions, it is termed an *internal sensation*; thus the impression communicated to the mind by the effect of light on the retina, and the painful sensation produced by a blow, are *external sensations*; the feeling of hunger and of restlessness are *internal sensations*. The external organs by which those impressions which cause sensation are primarily received, are called the organs of the senses; these are, the eye, the ear, the nose, the tongue, palate, &c., which constitute the organ of taste; and the extremities of nerves, dispersed under the common integuments, which give rise to the common sensation, feeling, or touch. The faculty of the mind by which we acquire the knowledge of bodies and their qualities, or perception, has been by some philosophers called *external sensation*; and those faculties by which we perceive novelty, sublimity, beauty, imitation, harmony, and ridicule, have been by some termed *secondary sensations*, by others *secondary senses*, and by others *emotions*.

SENSE, *n.* (sens.) [Fr. *sens*; from L. *sensus*, from *sentio*, to feel or perceive; W. *syniac*, id.; *syn*, sense, feeling, perception; G. *sinn*, sense, mind, intention.] 1. The faculty by which animals perceive external objects by means of impressions made on certain organs of the body. The senses are those faculties by which we become acquainted with some of the conditions of our own bodies, and with certain properties and states of external things, such as their colour, taste, odour, size, form, density, motion, &c. The senses are five in number, namely, sight, hearing, taste, smell, and touch; and each of them is exercised in the recognition of an impression conveyed along some nerve to the brain. Not only are the fingers organs of touch, but every part of the body, and not only do sensations arise from the contact of other bodies, but from affections of the nerves and muscles, when no perceptible contact occurs. Indeed there are no kinds of sensation produced by external causes, which we may not also derive from conditions of the nerves, arising independently of such external causes; but the same internal cause acting on the organs of the several senses produces, through the medium of each, a sensation peculiar to itself, and similar in kind to that perceived in the exercise of that organ's normal function; so that a nerve of one sense, can in no case discharge the function of a nerve of any other sense. The great end of the senses, however, is to make us acquainted with external objects and their qualities, and our perception of

these is accompanied with a belief that they exist, and are what they appear to be.—2. Sensation; perception by the senses.—3. Perception by the intellect; apprehension; discernment.

10. Meaning; import; signification; as, the true *sense* of words or phrases. In interpretation, we are to examine whether words are to be understood in a literal or figurative *sense*. So we speak of a legal *sense*, a grammatical *sense*, an historical *sense*, &c.—*Common sense*, that power of the mind which, by a kind of instinct, or a short process of reasoning, perceives truth, the relation of things, cause and effect, &c. and hence enables the possessor to discern what is right, useful, expedient or proper, and adopt the best means to accomplish his purpose. This power seems to be the gift of nature, improved by experience and observation.—*Moral sense*, a determination of the mind to be pleased with the contemplation of those affections, actions, or characters of rational agents, which are called good or virtuous.

impressions upon the organs of sense; the capacity of feeling or perceiving the impressions of external objects; *applied to animal bodies*; as when we say, a frozen limb has lost its *sensibility*. Among physiologists, *sensibility* is said to be that faculty of living parts by which they are capable of receiving impressions, which increase, diminish, alter, or suspend their functions. It is usually divided into *animal sensibility*, which gives rise to sensations; and *organic sensibility*, which calls into action the organic contractility. Some parts are endowed with a high degree of animal sensibility, while others possess hardly any. It is also more acute in some persons than in others.—2. Acuteness of sensation; *applied to the body*.—3. Capacity or acuteness of perception; that quality which renders us susceptible of impressions; delicacy of feeling; as, *sensibility to pleasure or pain*; *sensibility to shame or praise*; exquisite *sensibility*.—4. The sentiments include such faculties as not only produce a desire to act, but are combined with some other emotion or affection, which is not mere propensity. The sentiments are subdivided into those which are common to man with the lower animals, and those which are proper to man. Note.—In *Eng. law*, and *legislature*, there is a practical difference between a *divorce* and a *separation*. The ecclesiastical courts can grant the latter; it needs a special act of parliament, *pro re nata*, to obtain the former. *Separation* gives no power to either of the parties separated, leave to marry again; while *divorce* allows at least one of them to do so. Yet by a strange anomaly, the legislature, in recent times, has uniformly refused to give a complete divorce, (i. e. with leave to marry again), to any injured English wife, however great the wrongs sustained by her may have been: all that female complainants have yet obtained from parliament, after enormous expense incurred, has been a final *separation*.

The *sepia officinalis*, so common in the Mediterranean, is chiefly sought after on account of the profusion of colour which it affords. They are of a size somewhat less than European soldiers, but quite as brave, as active, and as hardy, capable of undergoing as much fatigue and of sustaining even greater privations. To the attachment and bravery of the Sepoys, Great Britain is chiefly indebted for the possession of her Indian empire. The native troops in the pay of the British government have been roughly estimated at 152,000 infantry and 2100 cavalry, the total number, including artillery, engineers, &c., being probably about 184,000.

SEPS, *n.* [*L.* from Gr. *σῆψα*. Cuvier.] The name of a genus of scincoid saurian reptiles, sometimes called *serpent-lizards*. They are found in the East Indies, the Cape of Good Hope, and on the coasts of the Mediterranean. SEP'TUAGINT, *n.* [L. *septuaginta*, seventy; *septem*, seven, and some word signifying ten.] A Greek version of the Old Testament, so called because it is supposed to have been the work of seventy, or rather of seventy-two interpreters. This translation from the Hebrew is supposed to have been made in the reign and by the order of Ptolemy Philadelphus, king of Egypt, about two hundred and seventy or eighty years before the birth of Christ. It is supposed, however, by modern critics that this version of the several books is the work, not only of different hands, but of separate times. It is probable that at first only the Pentateuch was translated, and the remaining books gradually. The Septuagint was in use up to the time of our Saviour, and is that out of which most of the citations in the New Testament from the Old are taken. It is an invaluable help to the right understanding of the Hebrew Scriptures. [Dr. Campbell supposes this version was so called because it was approved by the Sanhedrim.]

The seraglio of the sultan is a long range of buildings inhabited by the Grand Seigneur and all the officers and dependents of his court; and in it is transacted all the business of government. SER'JEANT, } is an almost incurable irregularity existent in spelling this word. The first mode is most consonant to etymology; but the second was unquestionably earliest, and longest in use, among us. On the other hand, we find most of our contemporaries, especially in military works, despatches, gazettes, &c., adopting the former spelling; hence has arisen an attempt among typographers to print the word *sergeants* when those of the army are mentioned, and confine the title *serjeant* to legal gentlemen of that rank. This practice is convenient at least, though, perhaps, hardly countenanced by any rule of analogy. [*See* SERJEANT, &c.]

Large sums they reckoned by sestertia; that is, sums of a thousand sestertii. The coin itself was called *sestertius*, or *sestertius nummus*, or simply *nummus*. The singular, *sestertium*, is never used alone for a thousand sestertii, but the plural, *sestertia*, for all multiples of a thousand sestertii, up to a thousand. One qualification of a Roman knight was the possession of estate of the value of four hundred thousand sesterces; that of a senator was double this sum. By statutes 13 and 14 Charles II. a legal settlement is declared to be gained by birth, by inhabitation, by apprenticeship, or by service for forty days. But the gaining of a settlement by so short a residence produced great evils, which were remedied by statute 1 James II. A settlement in this case may be made either by deed or by will, but the term is most commonly applied to such settlements as are made by deed, and these may be either made upon valuable or good consideration, or they may be purely voluntary. The most important species of settlements are marriage settlements. In Scots law, in cases of bankruptcy, when the creditors agree to give the insolvent person a discharge in full, on his paying them a part, instead of the whole of the debt he owes them, this is termed a settlement.—Disposition and settlement. Syr. and Eth. שבע, sheba.* In Ch. and Syr. שבע, *seba*, signifies to fill, to satisfy; in Ar. seven, and to make the number seven. In Heb. and Ch. שבע, *sheba*, is seven; Ar. *shabia*, to fill. With this orthography coincides the spelling of the Teutonic and Gothic words whose elements are *Sb*, or their cognates. But the Latin and Sanscrit have a third radical letter, as has the Persian, viz. *t*, and these coincide with the Ar. *sabata*, to observe the sabbath, to rest, Heb. Ch. and Syr. שבת, *shabath*. It is obvious then that *seven* had its origin in these verbs, and if the Persian and Greek words are from the same source, which is very probable, we have satisfactory evidence that the sibilant letter *s* has been changed into an aspirate. And this confirms an opinion that a similar change has taken place in the Gr. ἅλ, salt, *W. halen*, and in many other words.] Four and three; one more than six or less than eight. An instrument formed like a quadrant, excepting that its limb comprehends only 60 degrees, or the sixth part of a circle.

Sextant.

It is used for measuring the angular distances of objects by reflection. It is capable of very general application, but it is chiefly employed as a nautical instrument for measuring the altitudes of celestial objects, and their apparent angular distances. It is an instrument of the utmost importance in navigation.

The principle of the sextant, and of reflecting instruments in general, depends upon an elementary theorem in catoptrics; viz., if an object be seen by reflection from two mirrors which are perpendicular to the same plane, the angular distance of the object from its image is double the inclination of the mirrors. The angle of inclination of the two mirrors, in the case of the sextant, is measured by means of a graduated arch or limb, and an index. The double of this angle gives the apparent altitude of the observed object. The sextant used at sea generally goes by the name of Hadley's sextant, or quadrant.—3. To him also belongs the care of sweeping the church, and other similar menial offices.

It is found that most plants are hermaphrodite, the male and female organs being contained in the same flower. This doctrine was taught, to a certain extent, by Theophrastus, Dioscorides, and Pliny among the ancients, but has been more fully illustrated by Cæsalpinus, Grew, Camerarius, Linnaeus, and many others among the moderns.

The *Gr. σκία* is probably the same word contracted, and perhaps *σκιος*, darkness. In the sense of cutting off or separating, this word coincides exactly, as it does in elements, with the *G. scheiden*, *L. scindo*, for *scido*, which is formed on *cædo*, to strike off. Hence *Sax. gescead*, distinction, *L. scutum*, a shield, *Sp. escudo*; that which cuts off or intercepts. Owen deduces the Welsh word from *cawd*, something that incloses; but probably the sense is that which cuts off or defends.] 1. Literally, the interception, cutting off, or interruption of the rays of light; hence, the obscurity which is caused by such interception. *Shade* differs from *shadow*, as it implies no particular form or definite limit; whereas a *shadow* represents in form the object which intercepts the light. Hence, when we say, let us resort to the *shade* of a tree, we have no reference to its form; but when we speak of measuring a pyramid or other object by its *shadow*, we have reference to its extent.—2. Darkness; obscurity; as, the *shades* of night. The *shade* of the earth constitutes the darkness of night.—3. An obscure place, properly in a grove or close wood, which precludes the sun's rays; and hence, a secluded retreat.

SHADE, *v. t.* [*Sax. sceadan, gesceadan*, to separate, to divide, to shade.] 1. To shelter or screen from light by intercepting its rays; and when applied to the rays of the sun, it signifies to shelter from light and heat; as, a large tree *shades* the plants under its branches; *shaded* vegetables rarely come to perfection.

SHAD'OW, *n.* [*Sax. scadu, sceadu*. *See SHADE*.] 1. Shade within defined limits; obscurity or deprivation of light, apparent on a plane and representing the form of the body which intercepts the rays of light; as, the *shadow* of a man, of a tree or a tower. The *shadow* of the earth in an eclipse of the moon is proof of its sphericity. *Shadow* in *optics*, may be defined a portion of space from which light is intercepted by an opaque body. Every opaque object on which light falls is accompanied with a shadow on the side opposite to the luminous body, and the shadow appears more intense in proportion as the illumination is stronger. An opaque object illuminated by the sun, or any other source of light which is not a single point, must have an infinite number of shadows though not distinguishable from each other, and hence the shadow of an opaque body received on a plane is always accompanied by a *penumbra*, or partial shadow. In certain states of the atmosphere, the shadows of opaque objects projected on a white wall are frequently observed, about the time of sunset or sunrise, to be of a blue colour.—2. Darkness; shade; obscurity.

Night's sable *shadows* from the ocean rise. *Denham*.
